THE GREAT DIDACTIC
PART II.—TEXT
Published as one Volume in May 1896. Second Part reissued April 1907.
The Great Didactic

of

John Amos Comenius
The Great Didactic

Setting forth

The whole Art of Teaching
all Things to all Men

or

A certain Inducement to found such Schools in all the Parishes, Towns, and Villages of every Christian Kingdom, that the entire Youth of both Sexes, none being excepted, shall

Quickly, Pleasantly, & Thoroughly

Become learned in the Sciences, pure in Morals, trained to Piety, and in this manner instructed in all things necessary for the present and for the future life,

in which, with respect to everything that is suggested,

Its Fundamental Principles are set forth from the essential nature of the matter,
Its Truth is proved by examples from the several mechanical arts,
Its Order is clearly set forth in years, months, days, and hours, and, finally,

An easy and sure Method is shown, by which it can be pleasantly brought into existence.
Let the main object of this, our Didactic, be as follows: To seek and to find a method of instruction, by which teachers may teach less, but learners may learn more; by which schools may be the scene of less noise, aversion, and useless labour, but of more leisure, enjoyment, and solid progress; and through which the Christian community may have less darkness, perplexity, and dissension, but on the other hand more light, orderliness, peace, and rest.

God be merciful unto us and bless us, and cause his face to shine upon us;
That thy way may be known upon earth, thy saving health among all nations.—Psalm lxvii. 1, 2.
GREETING TO THE READER

[The References are to notes at the end of the book]

1. **Didactic** signifies the art of teaching. Several men of ability, taking pity on the Sisyphus-labour of schools, have lately endeavoured to find out some such Art, but with unequal skill and unequal success.

2. Some merely wished to give assistance towards learning some language or other with greater ease. Others found ways of imparting this or that science or art with greater speed. Others suggested improvements of various kinds; but almost all proceeded by means of unconnected precepts, gleaned from a superficial experience, that is to say, *a posteriori*.

3. We venture to promise a Great Didactic, that is to say, the whole art of teaching all things to all men, and indeed of teaching them with certainty, so that the result cannot fail to follow; further, of teaching them pleasantly, that is to say, without annoyance or aversion on the part of teacher or pupil, but rather with the greatest enjoyment for both; further of teaching them thoroughly, not superficially and showily, but in such a manner as to lead to true knowledge, to gentle morals, and to the deepest piety. Lastly, we wish to prove all this *a priori*, that is to say, from the unalterable nature of the matter itself, drawing off, as from a living source, the constantly flowing runlets, and bringing them together again into one concentrated stream, that we may lay the foundations of the universal art of founding universal schools.
4. The prospect which is here held out is indeed great and very desirable, though I can easily foresee that to many it will appear to be an idle dream rather than the exposition of a real possibility. In the meantime let each one, whoever he may be, withhold his judgment until he knows the true nature of my proposition. He will then be at liberty not only to form his judgment, but also to make it public. For I cannot wish, and much less can I claim, to hurry along any one by persuasion so that he give his approval to an insufficiently established proposition; but rather desire that each observer should naturally bring to bear on the matter, his own, and indeed his keenest senses (which should be dulled by no deceits of the imagination). This it is that I most earnestly demand and entreat.

5. The matter is indeed a serious one, and, as all should earnestly wish for the result, so should all, with united effort, carefully pass judgment on the means, since the salvation of the human race is at stake.

What better or what greater service could we perform for the state than to instruct and to educate the young? Especially at the present time and in the present condition of morals, when they have sunk so low that, as Cicero says, all should join to bridle them and keep them in check. It was Philip Melanchthon who remarked that to educate the young well was a greater feat than to sack Troy; and in this connection we may note the saying of Gregory Nazianzen:¹ "To educate man is the art of arts, for he is the most complex and the most mysterious of all creatures."

6. Now to portray the art of arts is a troublesome matter, and calls for exceptional criticism; and not that of one man alone, but of many; since no individual is so keen-sighted that the greater part of any matter does not escape his observation.

7. With justice therefore I demand from my readers, and adjure all who shall see this undertaking, by the salvation of mankind: firstly, not to attribute it to indiscretion if
any one resolve not only to investigate so weighty a matter, 
but also to give promises; since this can only have the 
advantage of others as its object. Secondly, not to lose 
heart at once, if the first attempt do not succeed on the 
spot, and the longed-for result be not brought to full com-
mpletion by us. For in any matter it is necessary that the 
seed should first sprout, and then raise itself gradually. 

However incomplete, therefore, our essay may be, and 
however much it fall short of the goal at which we aim, 
the investigation itself will prove that it has reached a 
higher stage, and one lying nearer the goal than hitherto. 
Finally, I ask my readers to bring with them to their 
criticism as much attention and keenness as is besfitting 
in matters of the greatest importance. It will be my first 
step to touch briefly on the circumstances that led to this 
essay and to enumerate the chief points that present any 
novelty; I can then with full confidence entrust the one to 
my reader’s candour, the other to his further research. 

8. This art of teaching and of learning was in former 
centuries to a great extent unknown, at any rate in that 
degree of perfection to which it is now wished to raise it, 
and on that account the world of culture and the schools 
were so full of toil and weariness, of weakness and deceits, 
that only those who were gifted with parts beyond the 
ordinary could obtain a sound education. 

9. But recently it has pleased God to let the morning 
glow of a newly-rising age appear, in which He has inspired 
some sturdy men in Germany, who, weary of the errors of 
the present method of instruction, began to think out an 
easier and shorter way of teaching languages. This they 
did, the one after the other, and therefore some with 
greater, others with less success, as may be seen in the 
didactic works that they gave to the world. 

10. I here allude to men like Ratke,2 Lubin,3 Helwig,4 
Ritter,5 Bodin,6 Glaum, Vogel,7 Wolfstirn,8 and he who 
deserves to be placed before them all, John Valentine 
Andræa9 (who in his golden writings has laid bare the 
diseases not only of the Church and the state, but also of
the schools, and has pointed out the remedies). In France too they set this stone in motion, since, in the year 1629, Janus Cæcilius Frey brought out a fine work on Didactic (under the title, *A new and easy way to the goodly Sciences and Arts, to Languages, and to Rhetoric*).

11. It is almost incredible what pleasure I found, and how my pain over the decline of my native land and the terribly oppressed state of all Germany was lightened whenever opportunity arose and I turned over the pages of these writings. For I began to hope that it was not without purpose that the providence of the Almighty had allowed it to come to pass that the decline of the old schools and the foundation of new ones in harmony with new ideas should take place at one and the same time. For he who intends to raise a new building, invariably levels the ground beforehand and removes the less comfortable or ruined houses.

12. This thought raised in me a joyful hope mingled with pleasant emotion; but I soon felt this vanish, and reflected that it would be impossible to reconstruct such an important institution from the very beginning.

13. As I wished for instruction on some points, and on others wished, myself, to instruct my fellows, I applied by letter first to one then to another of the above-mentioned writers. In vain, however, partly because some guarded their ideas with great care, partly because the letters did not reach those to whom they were directed, and therefore remained unanswered.

14. Only one of them (the renowned J. V. Andææ) sent the friendly answer that he wished to be of some assistance, and urged me to proceed with my efforts. Stimulated by this, my spirit began to take more daring flights, till at last my unbounded solicitude for the public good led me to take the matter thoroughly in hand.

15. So, putting on one side the discoveries, thoughts, observations, and admonitions of others, I began myself to investigate the matter thoughtfully and to seek out the causes, the principles, the methods, and the objects of the
art of teaching (*discentia* as they may be called after Tertullian).

16. This was the origin of my treatise, which, as I trust, develops the subject more thoroughly than has hitherto been done. It was first composed in my mother tongue for the use of my people, and afterwards on the advice of several men of standing translated into Latin, in order that, if possible, it might be of universal use.

17. For, as Lubin says in his Didactic, Charity bids us not to niggardly withhold from mankind what God has intended for the use of all, but to throw it open to the whole world.

For it is the nature of all true possessions that they can be shared by all; and that they advantage all more and more in proportion as they are shared by greater numbers.

18. It is also a law of human existence that if any know of assistance lying close at hand to those who are struggling he should not withhold it from them; especially in a case, as in the one before us, where the matter concerns not one but many, and not individuals merely but towns, provinces, kingdoms, and in short the whole human race.

19. Should there be any man who is such a pedant as to think that the reform of schools has nothing to do with the vocation of a Theologian, let him know that I was myself thoroughly penetrated with this idea. But I have found that the only way in which I can be freed from it is to follow God's call, and without digression to devote myself to that work to which the divine impulse directs me.

20. Christian readers, suffer me to speak with you confidentially! My more intimate friends know that I am a man of little ability and almost without literary training, but that, nevertheless, I lament the defects of the age, and make great endeavours to remedy these in any way that is possible, whether by means of my own discoveries or those of others (though this can only take place by the grace of God).

21. Therefore, if anything should find favour, it is not my work but His who is wont to win praise from the
mouths of children, and who in order to prove Himself faithful, earnest, and benign, gives to those who ask, opens to those who knock, and grants Himself to those who seek Him (Luke ii.), and whose good gifts to us we ought to pass on ungrudgingly to others. As my Saviour knows, my heart is so simple that it makes no difference to me whether I teach or am taught, whether I exhort or am exhorted, whether I am the teacher of teachers, or the scholar of scholars.

22. And so, what the Lord permits me to observe, that give I forth for public use and as common property.

23. If any find anything better, let him follow my example, lest, having buried his talent in a napkin, he be accused of wantonness by our Lord, who wills that His servants put out to usury so that the talent which is given to each may win another talent (Luke xix.).

To seek what is great is noble, was ever noble, and ever will be noble.
What thou hast begun with God cannot remain without result.
DEDICATORY LETTER

To all superiors of human society, to the rulers of states, the pastors of Churches, the parents and guardians of children, grace and peace from God the Father of our Lord Jesus Christ in the Holy Ghost.

God, having created man out of dust, placed him in a Paradise of desire, which he had planted in the East, not only that man might tend it and care for it, but also that he might be a garden of delight for his God.

For as Paradise was the pleasantest part of the world, so also was man the most perfect of things created. In Paradise each tree was delightful to look at, and more pleasant to enjoy than those which grew throughout the earth. In man, the whole material of the world, all the forms and the varieties of forms were, as it were, brought together into one in order to display the whole skill and wisdom of God. Paradise contained the tree of the knowledge of good and evil; man had the intellect to distinguish, and the will to choose between the good and the bad. In Paradise was the tree of life. In man was the tree of Immortality itself; that is to say, the wisdom of God, which had planted its eternal roots in man.

And so each man is, in truth, a Garden of Delights for his God, as long as he remains in the spot where he has been placed. The Church too, which is a collection of men devoted to God, is often in Holy Writ likened to a Paradise, to a garden, to a vineyard of God. But alas

1 Following Lindner, I have slightly curtailed this Dedicatory Letter.
for our misfortune! We have at the same time lost the Paradise of bodily delight in which we were, and that of spiritual delight, which we were ourselves. We have been cast out into the deserts of the earth, and have ourselves become wild and horrible wildernesess. We were ungrateful for the gifts, both of the body and of the soul, with which God had so richly provided Paradise; with right therefore have we been deprived of them and been dowered with calamity.

But glory, praise, honour, and blessing for everlasting to our merciful God who abandoned us for a while but did not thrust us from Him for ever. . . . The garden of the Church, the delight of God's heart, blooms anew.

But does this new plantation of God succeed entirely according to His wishes? Do all the shoots grow successfully? Do all the newly-planted trees bring forth spike-nard, crocus, cinnamon, myrrh, spices, and costly fruits? Do we hear the voice of God calling to His Church: I had planted thee a noble vine, wholly a right seed: how then art thou turned into the degenerate plant of a strange vine unto me? (Jeremiah ii. 21). Here we have the complaint of God that even this new plantation of Paradise is deteriorating. . . .

He who knows not that he is ill cannot heal himself; he who feels not his pain utters no sigh; he who sees not his danger does not start back, even though he be on the brink of an abyss; and so it is not to be wondered at that he who perceives not the wave of disorder which is sweeping over the human race and over the Church, does not lament the fact. But he who sees himself and others covered with countless wounds; he who remarks that the wounds and boils, both his own and other men's, fester ever more and more; and who knows that he, with others, stands in the midst of gulfs and precipices and wanders among snares, in which he sees one man after another being caught, it is hard for him not to be terrified, not to marvel, not to perish with grief.

For what part of us or of our concerns is in good
condition? None. Everything lies overturned or in shreds. With most men such a dulness of wit is predominant, instead of the understanding through which we ought to be equal to the angels, that they know no more about those things which are worthy of our attention than do the beasts. Instead of the circumspection with which those who are destined for eternity ought to prepare themselves for it, there reigns such forgetfulness, not only of eternity but also of mortality, that most men give themselves up to what is earthly and transient, yea, even to the death that stands before them. Instead of the godly wisdom through which it has been given to us to know, to honour, and to enjoy the One who is the height of all goodness, there has arisen a horrible shrinking from that God in whom we live, move, and have our being, and a foolish conjuration of His holy name. Instead of mutual love and purity, reign hatred, enmity, war, and murder. Instead of justice, we find unfairness, roguery, oppression, theft, and rapine; instead of purity, uncleanness and audacity of thought, word, and deed; instead of simplicity and truth, lying, deception, and knavery; instead of modesty, pride and haughtiness between man and man.

But in spite of all this, there remains for us a twofold comfort. First, that God keeps the eternal Paradise in readiness for His chosen ones, and that there we shall find a perfection, more complete and more durable than that first one which we lost. Into this Paradise went Christ (Luke xxiii. 43), thither was Paul caught up (2 Corinthians xii. 4), and John saw its splendour with his own eyes (Rev. i. 12; xxi. 10).

Another consolation consists in this, that here below also God continually renews the Paradise of the Church, and turns its deserts into a garden of delights. We have on several occasions seen with what grandeur this has already taken place: after the Fall, after the Flood, after the entrance of the children of Israel into the land of Canaan, under David and Solomon, after the return from Babylon and the rebuilding of Jerusalem, after Christ's ascension into heaven.
and the preaching of the Gospel to all nations, under Constantine, and elsewhere. Perchance even now, after such a bloody war and after such devastation, the Father of mercy looks upon us graciously: how thankfully should we approach Him, and ourselves take care of our own interests, working by those ways and means which the most wise God, the Ordainer of all things, will show us.

The most useful thing that the Holy Scriptures teach us in this connection is this, that there is no more certain way under the sun for the raising of sunken humanity than the proper education of the young. Indeed Solomon, after he had gone through the whole labyrinth of human error and had mournfully recognised that perverseness could not be cured nor imperfections enumerated, turned at length to the young and adjured them to remember their Creator in the days of their youth, to fear Him, and to keep His commandments, for that this was the whole duty of man (Eccles. xii. 13). And in another place, “Train up a child in the way he should go, and when he is old he will not depart from it” (Proverbs xxii. 6). David also says, “Come, ye children, hearken unto me: I will teach you the fear of the Lord” (Psalm xxxiv. 11). The heavenly David himself, the true Solomon, the eternal Son of God who came down from heaven to turn us from sin, leads us on to the same path when He says, “Suffer the little children to come unto me, and forbid them not: for of such is the kingdom of God” (Mark x. 14), and said to us besides, “Verily I say unto you, Except ye be converted, and become as little children, ye shall not enter into the kingdom of heaven” (Matthew xviii. 3). What advice is this! Hear, all of you, and weigh carefully what the Lord and Master declares; how He announces that the little ones only are fit for the kingdom of God, that they are heirs of the kingdom and that only those who become as little children are to be admitted to share this inheritance. O dear children, may you rightly appreciate this godly privilege! Just consider, we elders, who consider that we alone are men, but that you are apes, that we alone are wise, and that you lack
sense, that we are eloquent, but you speechless—we, I say, are sent to learn our lessons from you! You are set over us as masters, you are to be our models and examples. If any one should wish to deliberate why God prizes children so highly, he will find no weightier reason than this, that children are simpler and more susceptible to the remedy which the mercy of God grants to the lamentable condition of men. For this reason it is that Christ commands us elders to become as little children, that is, to throw off the evil that we have gained from a bad education and from the evil examples of the world, and to return to our former condition of simplicity, gentleness, modesty, purity, and obedience. But, because nothing is harder than to lay aside our habits, it comes to pass that there is no more difficult task than for a badly-trained man to return to his former state. The tree remains as it grows, high or low, with straight or with crooked branches, and when it is full grown cannot be altered. The felloe, the piece of wood which has been bent to the shape of the wheel and has become hard in this position, breaks rather than be straightened, as experience teaches us. God also says the same of men who are accustomed to evil dealing: “Can the Ethiopian change his skin or the leopard his spots? then may ye also do good that are accustomed to do evil” (Jeremiah xiii. 23). From this it necessarily follows that, if the corruption of the human race is to be remedied, this must be done by means of the careful education of the young.

But in order to educate the young carefully it is necessary to take timely precautions that their characters be guarded from the corruptions of the world, that the seed of honour sown in them be brought to a happy growth by pure and continuous teaching and examples, and, lastly, that their minds be given over to the true knowledge of God, of man, and of nature, that they may grow accustomed to see in this light the light of God, and to love and to honour the Father of Light above all things.

If this take place, the truth of the Psalmist's words will
be evident, "Out of the mouth of babes and sucklings hast thou ordained strength because of thine enemies, that thou mightest still the enemy and the avenger" (Psalm viii. 3).

For this reason has God given the little ones angels as guardians (Matthew xviii. 10), has placed their parents over them to take care of them, and bidden to bring them up in the nurture and admonition of the Lord (Ephesians vi. 4); and thus He solemnly bids all others, under penalty of eternal damnation, not to lead the young into sin through a bad example (Matthew xviii. 6, 7).

But how are we to carry this out when corruption is spreading so rapidly? In the time of the Patriarchs, since these holy men dwelt in seclusion from the world, and, in their own families, were not only fathers but priests, masters, and teachers as well, this was not such a difficult matter. For, after they had removed their children from intercourse with wicked men and had enlightened them by good and virtuous example, they brought them up by gentle admonition, encouragement, and, where necessary, by correction. God Himself is witness that Abraham did so, when He says: "For I know him, that he will command his children and his household after him, and they shall keep the way of the Lord to do justice and judgment" (Genesis xviii. 19). But now we dwell close together, the good and the bad are mingled, and the bad are many more than the good. The example of these men makes so powerful an impression on the young that the precepts for the practice of virtue, which we administer as an antidote against evil, have either no result at all or one that is inappreciable. But what must be the result if even these precepts are seldom delivered? There are few parents who are in the position to teach their children anything good, either because they have themselves never learned anything of the kind, or because their heads are full of other things; and thus education is neglected.

There are also few teachers who can bring good principles home to the young, and when one arises he is snatched up by some man in high position that he may
busy himself with his children; the people get little advantage from him. Thus it comes to pass that the rest of the children grow up without the education that they need, like a forest which no one plants, waters, cuts, or keeps in order. Hence it is that we find unruly manners and customs in the world, in towns and in market-places, in houses and in men, for these both in body and soul are full of confusion. If Diogenes, Socrates, Seneca, or Solomon were to come to life again this day and visit us, they would find the world in the same state as formerly. Were God to address us from heaven He could only say as He said before: “They are all gone astray, they are altogether become filthy: there is none that doeth good, no, not one” (Psalm xiv. 3). If, therefore, any man exist who can devise some plan, or who with tears, sighs, and entreaties can obtain from heaven a method by which some improvement may be made in the youth who are growing up, let him not hold his tongue, but rather let him advise, think, and speak. “Cursed be he that maketh the blind to wander out of the way,” says God (Deuteronomy xxvii. 18). And cursed, therefore, is he who can free the blind from their error and does not do so. “Woe unto him who shall offend one of these little ones,” says Christ (Matthew xviii. 6, 7). Woe also unto him who can prevent injury and does not. God wills not that the ass or the ox that strays through field and forest and sinks under its burden be deserted, but that it receive help, even if the helper do not know to whom it belongs, or if he know that it is his enemy’s (Deuteronomy xxii. 1). Can it then please Him that we pass by without thought, and stretch out no helping hand, when we see the errors, not of beasts, but of intelligent beings, not of one or two, but of the whole world? Let this be far from us!

Cursed be he that doeth the work of the Lord deceitfully, and cursed be he that keepeth back his sword from blood (Jeremiah xlviii. 10). And yet we hope to remain guiltless while we thoughtlessly suffer the terrible Babylon of error that is ours! Up, let him seize his sword who is
girt with one, or who knows where one lies buried in its sheath! Let him demand the destruction of Babylon, that he be blessed by the Lord!

And so fulfil this command of the Lord with eagerness, ye rulers, ye servants of the Most High, and with the sword of righteousness banish the disorder with which the world is filled.

Busy yourselves, ye governors, ye faithful servants of Jesus Christ, and utterly destroy evil with the sword that is entrusted to you, with the two-edged sword of speech! Ye have seen that early youth is the best time to attack the evils of the human race; that the tree which is to thrive for ages is best planted when quite young; that Sion is most easily raised on the site of Babylon when the living building-stones of God, the young, are early broken, shaped, and fitted for the heavenly building. If we wish to have well-ordered and prosperous Churches, states, and households, thus and in no other way can we reach our goal.

But how to take this in hand and to carry it out with the desired result, this I will place before your eyes, I whose spirit the Lord has called to the work. See, hear, and mark its nature carefully, you to whom the Lord has given eyes to see, ears to hear, and minds to judge.

If a light, unseen before, be revealed to any, let him give God the glory and not grudge the illumination to the rising generation. But if he perceive any defect, even the smallest, in this light, let him complete and perfect it, or, that it may be perfected, let him recall the saying, "Many eyes are better than one."

Thus we shall mutually help one another to carry out the work of God with unanimity; thus we shall escape the curse which threatens those who neglect the Lord’s work; thus we shall consult the welfare of the world’s most precious possession, the young, as much as is possible; thus we shall shine with the brightness granted to those that turn others to righteousness (Daniel xii. 3).

May God have mercy on us, that we see the light! Amen.
The Use of the Art of Teaching

That the art of teaching be placed on a proper foundation is to the advantage—

1. Of parents, who up to this time have for the most part been uncertain how much to expect from their children. They hired tutors, besought them, strove to win them over by gifts, changed them, just as often in vain as with any result. But now that the method of teaching has been reasoned out with unerring accuracy, it will, with the assistance of God, be impossible that the desired result should not follow.

2. Of schoolmasters, the greater number of whom have been quite ignorant of their art, and who used therefore to wear themselves out when they wished to fulfil their duty, and to exhaust their strength in laborious efforts: or used to change their method, trying in turn first one plan then another—a course which involved a tedious waste of time and of energy.

3. Of students, who may master the sciences without difficulty, tedium, complaints, or blows, as if in sport and in merriment.

4. Of schools, which, when the method has been established, will be not only preserved continuously in full vigour, but increased without limit. For they will indeed become places of amusement, houses of delights and attractions, and since (on account of the infallibility of the method) each student, of whatever capacity, will become a doctor (of a higher or lower grade), it will never be
possible for a dearth of suitable school-teachers to arise, or for learning not to flourish.

5. Of states, according to the testimony of Cicero. With whom agrees that of Diogenes the Pythagorean (to be found in Stobæus²). For what is the foundation of the whole state? Surely, the development of the young. Since vines that have not been well cultivated will not bear good fruit.

6. Of the Church, since the proper organisation of schools alone can bring it about that the churches shall never lack learned doctors, and that learned doctors shall never lack suitable hearers.

7. And lastly, it is to the advantage of heaven that schools should be reformed for the exact and universal culture of the intellect, that those whom the sound of the divine trumpet is unable to stir up may be the more easily freed from darkness by the brilliancy of the divine light. For, although the Gospel be preached everywhere (and we hope that it will be preached to the ends of the earth), still the same thing is apt to happen as takes place in any meeting-place, tavern, or other tumultuous gathering of men, that not he alone is heard or gains particular attention who brings forward the best things, but that each one occupies with his own trifles the man near whom he happens to sit or to stand. Thus it comes to pass in the world. Though the ministers of the World fulfil their duty with great zeal; though they talk, orate, exhort, testify, they none the less remain unheard by the greater part of mankind. For many never go to religious meetings except by chance; others come with their ears and eyes closed, and, as their minds are occupied with other matters, pay little attention to what is taking place. And lastly, if they do attend and grasp the purport of the sacred exhortation, they are not so greatly affected by it as they should be, since the accustomed sluggishness of their minds, and the evil habits that they have acquired, blunt, bewitch, and harden them, so that they are unable to free themselves from their old custom. And thus they stick
fast in their habitual blindness and sin, as if bound so firmly by chains that none but God Himself could free them from their ingrained perverseness. As one of the fathers has said, it is very near a miracle if an inveterate sinner be converted to repentance. Now, as in other matters, so in this; where God supplies means, to ask for a miracle is to tempt Him. Let us therefore consider it our duty to meditate on the means by which the whole Christian youth may be more fervidly stirred up to vigour of mind and love of heavenly things. If we can attain this we shall see the kingdom of heaven spread more and more, as of old.

Let none therefore withdraw his thoughts, desires, strength, or resources from such a sacred undertaking. He who has given the will, will also grant its fulfilment, and we ought without exception to demand this with good heart from the divine mercy. For the salvation of man and the glory of the Most High is at stake.

P.S.—It is inglorious to despair of progress, and wrong to despise the counsel of others.
SUBJECTS OF THE CHAPTERS

I. Man is the highest, the most absolute, and the most excellent of things created

II. The ultimate end of man is beyond this life

III. This life is but a preparation for eternity

IV. There are three stages in the preparation for eternity: to know oneself (and with oneself all things); to rule oneself; and to direct oneself to God

V. The seeds of these three (learning, virtue, religion) are naturally implanted in us

VI. If a man is to be produced, it is necessary that he be formed by education

VII. A man can most easily be formed in early youth, and cannot be formed properly except at this age

VIII. The young must be educated in common, and for this schools are necessary

IX. All the young of both sexes should be sent to school

X. The instruction given in schools should be universal
XI. Hitherto there have been no perfect schools 76
XII. It is possible to reform schools 81
XIII. The basis of school reform must be exact order in all things 93
XIV. The exact order of instruction must be borrowed from nature 98
XV. The basis of the prolongation of life 104
XVI. The universal requirements of teaching and of learning; that is to say, a method of teaching and of learning with such certainty that the desired result must of necessity follow 111
XVII. The principles of facility in teaching and in learning 127
XVIII. The principles of thoroughness in teaching and in learning 142
XIX. The principles of conciseness and rapidity in teaching 160
XX. The method of the sciences, specifically 183
XXI. The method of the arts 194
XXII. The method of languages 203
XXIII. The method of morals 211
XXIV. The method of instilling piety 218
XXV. If we wish to reform schools in accordance with the laws of true Christianity, we must remove from them books written by pagans, or, at any rate, must use them with more caution than hitherto 231
XXVI. Of school discipline 249

CHAPTER I

MAN IS THE HIGHEST, THE MOST ABSOLUTE, AND THE MOST EXCELLENT OF THINGS CREATED

1. When Pittacus of old gave to the world his saying "Know thyself," the sentiment was received by the wise with so much approval, that, in order to impress it on the people, they declared that it had fallen from heaven, and caused it to be written in golden letters on the temple of the Delphic Apollo, where great assemblies of men used to collect. Their action was prudent and wise; but their statement was false. It was, however, in the interests of truth, and is of great importance to us.

2. For what is the voice from heaven that resounds in the Scriptures but "Know thyself, O man, and know Me." Me the source of eternity, of wisdom and of grace; thyself, My creation, My likeness, My delight.

3. For I have destined thee to be the companion of My eternity; for thy use I designed the heaven, the earth and all that in them is; to thee alone I gave all those things in conjunction, which to the rest of creation I gave but singly, namely, Existence, Vitality, Sense, and Reason. I have made thee to have dominion over the works of My hands. I have placed all things under thy feet, sheep and oxen and the beasts of the field, the fowl of the air and the fish of the sea, and I have crowned thee with glory and with honour (Psalm viii.) To thee, finally, lest anything should be lacking, I have given Myself in personal communion, joining My nature to thine for eternity, and
in this distinguishing thee from all created things, visible and invisible. For what creature in heaven or in earth can boast that God was manifest in his flesh and was seen of angels (1 Tim. iii. 16), not, forsooth, that they might only see and marvel at Him whom they desired to see (1 Peter i. 12), but that they might adore God made manifest in the flesh, the son of God and of man (Hebrews i. 6; John i. 51; Matthew iv. 11). Know therefore that thou art the corner-stone and epitome of My works, the representative of God among them, the crown of My glory.

4. Would that this were inscribed, not on the doors of temples, not on the title-pages of books, not on the tongues, ears, and eyes of all men, but on their hearts! Would that this could be done to all who undertake the task of educating men, that they might learn to appreciate the dignity of the task, and of their own excellence, and might bring all means to bear on the perfect realisation of their divinity!
CHAPTER II

THE ULTIMATE END OF MAN IS BEYOND THIS LIFE

1. REASON itself dictates that such a perfect creature is destined to a higher end than all other creatures, that of being united with God, the culmination of all perfection, glory, and happiness, and of enjoying with Him absolute glory and happiness for ever.

2. Now although this is clear from Scripture, and we stedfastly believe that it is the truth, it will be no loss of time if we lightly touch on the various ways in which God has indicated that our destination lies beyond this life.

3. First, in the creation itself; for He did not simply command man to exist, as He did the rest of His creatures; but, after solemn consideration, He formed a body for him with His own fingers and breathed the soul into it from Himself.

4. Our nature shows that this life is not sufficient for us. For here we live a threefold life, the vegetative, the animal, and the intellectual or spiritual. Of these the action of the first is confined to the body, the second can extend itself to objects by the operation of the senses and of movement, while the third is able to exist separately, as is evident in the case of angels. So that, as it is evident that this, the last stage of life, is greatly overshadowed and hindered in us by the two former, it follows of necessity that there will be a future state in which it may be brought to perfection.
5. All our actions and affections in this life show that we do not attain our ultimate end here, but that everything connected with us, as well as we ourselves, has another destination. For whatever we are, do, think, speak, contrive, acquire, or possess, contains a principle of gradation, and, though we mount perpetually and attain higher grades, we still continue to advance and never reach the highest.

For in the beginning a man is nothing, and has been non-existent from eternity. It is from his mother's womb that he takes his origin. What then is a man in the beginning? Nothing but an unformed mass endowed with vitality. This soon assumes the outlines of a human body, but has, as yet, neither sense nor movement.

Later on it begins to move and by a natural process bursts forth into the world. Gradually the eyes, ears, and other organs of sense appear. In course of time the internal senses develope and the child perceives that he sees, hears, and feels. Then the intellect comes into existence by cognising the differences between objects; while, finally, the will assumes the office of a guiding principle by displaying desire for certain objects and aversion for others.

6. But in all these individual points of progress we find nothing but succession. For the intelligence that underlies matter makes itself seen by degrees, like a ray of dawn shining through the darkness of night, and, as long as life remains, there is a continual access of light, unless a man become utterly brutish. Thus our actions are at first weak, unformed and confused; then the virtues of the mind unfold themselves proportionately to the forces of the body, so that as long as we live (unless the greatest lethargy take possession of us and bury us alive) we are continually exercising our faculties.

In a worthy mind all these functions tend to a higher development, nor can we find any end of the things that we desire or wish to accomplish.

7. In whatever direction a man turns he may perceive
this experimentally. If any have an excessive desire for riches he will not find anything that can satisfy his greed, though he possess the whole world; as was evident in the case of Alexander. If any burn with desire for honour he will not be able to rest though the whole world adore him.

If any give himself over to pleasure, rivers of delight may bathe all his senses, but he becomes accustomed to them, and his appetite continues to desire one thing after another. If any apply his mind to the study of wisdom he will find no end; for the more a man knows, the more he realises his ignorance. Rightly did Solomon say that the eye could not grow tired of seeing or the ear of hearing.

8. Indeed, the examples of those who die teach us that death does not put the last touch to existence. For those whose life has been righteous rejoice that they are to enter on a better one; while those who are filled with love of the present life, seeing that they must leave it and migrate elsewhere, begin to tremble and to reconcile themselves with God and man, if by any chance this be still possible. And, although the body, broken down by pain, grows faint, the senses become clouded, and life itself slips away, the mind fulfils its functions more vividly than ever, as we see when a man circumspectly summons his family and heirs about his death-bed. So that he who sees a pious and wise man dying sees nothing but the structure of clay falling asunder; he who listens to him hears an angel's voice and cannot but confess that the dweller is only taking his departure while the house falls to ruin about him. Even the heathen understood this, so that the Romans, according to Festus,\textsuperscript{14} called death \textit{abitio}, and with the Greeks, \textit{οἶχεσθαι}, which signifies "to go away," is frequently used instead of "to die" and "to perish." This can only be because by "death" nothing is understood but transition to another life.

9. This is all the more evident to us Christians, now that Christ, the Son of the living God, has been sent from
heaven to regenerate in us the image of God. For having been conceived of a woman He walked among men; then, having died, He rose again and ascended into heaven, nor had death any more dominion over Him. Now He has been called "our forerunner" (Hebr. vi. 20), "the firstborn among his brethren" (Rom. viii. 30), "the head over all things" (Ephes. i. 22), and the archetype of all who are to be formed in the image of God (Rom. viii. 29).

As then, He did not visit this earth in order to remain on it, but that, when His course was run, He might pass to the eternal mansions; so we also, His companions, must pass on and must not make this our abiding-place.

10. To each of us, then, his life and his abiding-place is threefold. The mother's womb, the earth, and the heaven. From the first into the second he passes by nativity, and from the second into the third by death and resurrection. From the third he makes no move, but rests there for all eternity.

In the first stage we find life in its simplicity, with the commencement of movement and of feeling. In the second we have life, motion, sense, and the elements of intellect. In the third we find the full plenitude of all.

11. The first life is preparatory to the second, and the second to the third, while the third exists for itself and is without end. The transition from the first into the second and from the second into the third, is narrow and accompanied by pain; and in both cases some covering or surrounding must be laid aside (in the first case the after-birth, in the second the body itself), just as the egg-shell is discarded when a chicken is hatched. Thus the first and second abiding-places are like workshops in which are formed, in the first the body, for use in the following life; in the second the rational soul, for use in the life everlasting. In the third abiding-place the perfection and fruition of both will be realised.

12. Thus (to use them as a type) were the Israelites born in Egypt. Thence, through the passes of the
mountains and through the Red Sea, they were brought into the desert. They built temples, they learned the law, they fought with various tribes, and, at length, having with difficulty crossed the Jordan, they were made heirs of Canaan, the land flowing with milk and honey.
CHAPTER III

THIS LIFE IS BUT A PREPARATION FOR ETERNITY

1. That this life, since its destination is elsewhere, is not (properly speaking) a life at all, but only the prelude to a real and everlasting existence, will be evident, firstly, from the witness of our own selves, secondly, from the world, and, thirdly, from the Holy Scriptures.

2. If we examine ourselves, we see that our faculties grow in such a manner that what goes before paves the way for what comes after. For example, our first life is in our mother's womb. But for the sake of what does it exist? of the life itself? Not at all. The process that here takes place is intended to form the embryo into the suitable abiding-place and instrument of the soul, for convenient use in the life on earth which follows. As soon as this preparation is finished we burst forth into the light because in this stage no further development is possible. In the same way, this life on earth is nothing but a preparation for eternity, and exists in order that the soul, through the agency of the body, may prepare for itself those things which will be of use in the future life. As soon as this is accomplished we go hence, because further undertakings are of no avail. Many of us, also, are snatched away unprepared or are hurled to destruction, just as abortive embryos are produced from the womb, destined not for life but for death. In each of which cases
God, it is true, gives His permission, but man is the guilty cause.

3. The visible world itself, from whatever point of view we regard it, bears witness that it has been created for no other end than that it may serve for the progeneration, the nutrition, and the training of the human race. For as it pleased God not to create all men at the same moment, as was done with the angels, but only a male and a female who should increase by generation; and, as a sufficient length of time was necessary for this purpose, He granted some thousands of years. And in order that this period might not be confused, silent, and dark, He spread forth the heavens and placed in them the sun, the moon, and the stars, and commanded these, by circling round, to measure out the hours, the days, the months, and the years. Further, because the beings whose birth was contemplated were corporeal and needed a place to dwell in, space to breathe and move in, food to nourish them, and clothing to adorn them, He constructed in the lowest part of the firmament a solid substratum, the earth. Around this He poured the air, He irrigated it with waters, and bade plants and animals of various kinds to spring forth; and this not only to supply necessary wants, but also to promote enjoyment. And because He had made man in His own image and had given him a mind, in order that its proper nutrition might not be wanting to that mind, He divided each class of creatures into many species, that this visible universe might be a continual mirror of the infinite power, wisdom, and goodness of God, and that by its contemplation man might be compelled to marvel at the Creator, moved to recognise Him, and enticed to love Him, when the might, the beauty, and the sweetness that lie invisible in the abyss of eternity shone out on all sides through these visible manifestations, and suffered themselves to be handled, seen, and tasted. Thus the world is nothing but our nursery, our nurturing place, and our school, and there is, therefore, a place beyond, whither we shall be transferred when we are
dismissed from the classes of this school and are sent to that university which is everlasting. Reason alone makes this truth manifest, but it is more plainly visible in the divine oracles.

4. God Himself testifies in Hosea that the heavens exist for the sake of the earth, the earth that it may produce corn, wine, and oil, and these in turn for man (Hosea ii. 21, 22). All things therefore, even time itself, exist for the sake of man. For no longer a duration of time will be granted than is necessary to fill up the number of the elect (Rev. vi. 11). As soon as this is accomplished the heavens and the earth will pass away and the place shall know them no more (Rev. xi. 1). For a new heaven and a new earth will appear, in which justice shall dwell (Rev. xxi. 1; 2 Peter iii. 13). And finally, the way in which the Scriptures speak of this life show that it is nothing but the preparation for that to come. For they call it a way, a progress, a gate, and an expectation, while us they call pilgrims, newcomers, sojourners, and lookers forward to another and lasting state (Gen. xlvii. 9; Psalm xxxix. 12; Job vii. 10; Luke xii. 33).

5. Now this we are taught by the facts themselves and by the manifest condition of all men. For what mortal has ever existed who, having been born, has not disappeared again from the earth, since we have been destined for eternity. This being the case, it follows that our state here is one of transition. Whence Christ says, "Therefore be ye also ready, for in an hour that ye think not the Son of Man cometh" (Matt. xxiv. 44). And this is the reason (as we learn from Scripture) that God calls some hence in early youth; for He sees that they are ready, as was Enoch (Gen. v. 24; Wisdom iv. 14). Why, on the other hand, does He show such long-suffering toward the wicked? Because He does not wish that any should be overtaken unprepared, but that he should repent (2 Peter iii. 9). If, however, any man abuse the patience of God, He bids him be snatched away.

6. As, then, it is certain that our sojourn in our mother's
womb is a preparation for the life in the body, so certain is it that our sojourn in the body is a preparation for the life which shall follow this one, and shall endure for ever. Happy is he who leaves his mother's womb with limbs well formed! Happier a thousand times is the man who shall bear his soul hence in purity and cleanliness.
CHAPTER IV

THERE ARE THREE STAGES IN THE PREPARATION FOR ETERNITY: TO KNOW ONESELF (AND WITH ONESELF ALL THINGS); TO RULE ONESELF; AND TO DIRECT ONESELF TO GOD.

1. It is evident, then, that the ultimate end of man is eternal happiness with God. The subordinate ends, also, at which we aim in this transitory life, are evident from the words of the divine soliloquy which the Creator uttered when about to make man. "Let us make man," He said, "in our image, after our likeness; and let them have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth, and over every creeping thing that creepeth upon the earth" (Gen. i. 26).

2. From which it is plain that man is situated among visible creatures so as to be
   (i.) A rational creature.
   (ii.) The Lord of all creatures.
   (iii.) A creature which is the image and the joy of its Creator.

These three aspects are so joined together that they cannot be separated, for in them is laid the basis of the future and of the present life.

3. To be a rational creature is to name all things, and to speculate and reason about everything that the world contains, as we find it in Gen. ii. 19, or, in the words of
Solomon (Wisdom vii. 17), to know how the world was made and the operation of the elements; the beginning, ending, and midst of the times; the alterations of the turning of the sun, and the change of seasons; the circuits of years and the positions of stars; the natures of living things and the furies of wild beasts; the violence of winds and the reasonings of men; the diversities of plants and the virtues of roots; in a word, everything that is secret and that is manifest. To man belong the knowledge of handicrafts and the art of speaking, lest (as says the son of Sirach) anything should remain unknown, be it small or great, in any department of knowledge (Eccles. v. 12). For thus, if he know the properties of all things, will he be able to justify his title of "rational being."

4. To be the lord of all creatures consists in subjecting everything to his own use by contriving that its legitimate end be suitably fulfilled; in conducting himself royally, that is, gravely and righteously, among creatures (adoring only one above him, his Creator; recognising God's angels, man's fellow-servants, as his equals, and considering all other things as far beneath him). Thus will he preserve the dignity which has been granted to him. He should enslave himself to no creature, not even to his own flesh and blood; but should use all freely in his service, and not be ignorant where, when, how, and to what extent each may prudently be used, how far the body should be gratified, and how far our neighbour's interests should be consulted. In a word, he should be able to control with prudence his own movements and actions, external and internal, as well as those of others.

5. Finally; to be the image of God is to represent the perfection of his Archetype, who says Himself "Ye shall be holy, for I the Lord your God am holy" (Lev. xix. 2).

6. From this it follows that man is naturally required to be: (1) acquainted with all things; (2) endowed with power over all things and over himself; (3) to refer himself and all things to God, the source of all.
Now, if we wish to express these three things by three well-known words, these will be:

(i.) Erudition.
(ii.) Virtue or seemly morals.
(iii.) Religion or piety.

Under Erudition we comprehend the knowledge of all things, arts, and tongues; under Virtue, not only external decorum, but the whole disposition of our movements, internal and external; while by Religion we understand that inner veneration by which the mind of man attaches and binds itself to the supreme Godhead.

7. In these three things is situated the whole excellence of man, for they alone are the foundation of the present and of the future life. All other things (health, strength, beauty, riches, honour, friendship, good-fortune, long life) are as nothing, if God grant them to any, but extrinsic ornaments of life, and if a man greedily gape after them, engross himself in their pursuit, occupy and overwhelm himself with them to the neglect of those more important matters, then they become superfluous vanities and harmful obstructions.

8. To illustrate the matter by an example. The time-piece (either the sun-dial or the mechanical clock) is an elegant and very necessary instrument for measuring time, and its essential excellence depends on the accurate joining together of all its parts. The case which is added, the chasings, the engravings, and the gildings are accessories which add something to its external appearance, but nothing to its utility. Were any to prefer a handsome clock to a good one, men would laugh at him for not realising in what the essential excellence of the object consisted. In the same way, the value of a horse consists in its strength, combined with spirit, speed, and promptness in obeying its rider’s wishes. A flowing tail or one tied in a knot, hair combed and standing erect, gilded bits, gay coverings, and trappings of whatever kind, add decorative beauty, it is true, yet we call a man a fool if we see that he measures a horse’s excellence by them.
Finally, a sound condition of health depends on the proper cooking of food, and on our digestive organs being in good order. To sleep softly, to dress well, and to fare delicately, add nothing to our health, but rather detract from it, and therefore a man is a fool who prefers dainties to wholesome viands. But much more, and to his own damnation, is that man a fool who, wishing to be a man, gives more heed to the ornaments than to the essentials of human existence. The Preacher, therefore, pronounces those ignorant and impious who think that our life is a pastime or a simple pursuit of wealth, and says that the praise and the blessing of God is very far from them (Wisdom xv. 12, 19).

9. It follows, therefore, that we advance towards our ultimate end in proportion as we pursue Learning, Virtue, and Piety in this world.

These three are undoubtedly the main issues of our life; all else are side channels, hindrances, or ornamentations.
CHAPTER V

THE SEEDS OF THESE THREE (LEARNING, VIRTUE, AND PIETY) ARE NATURALLY IMPLANTED IN US

1. By the word nature we mean, not the corruption which has laid hold of all men since the Fall (on which account we are naturally called the children of wrath, unable of ourselves to have any good thoughts), but our first and original condition, to which, as to a starting-point, we must be recalled. It was in this sense that Ludovicus Vives said, "What else is a Christian but a man restored to his own nature, and, as it were, brought back to the starting-point from which the devil has thrown him?" (Lib. i. De Concordia et Discordia). In this sense, too, must we take the words of Seneca, "This is wisdom, to return to nature and to the position from which universal error (that is to say, the error of the human race, originated by the first men) has driven us," and again, "Man is not good but becomes so, as, mindful of his origin, he strives toward equality with God. No man who is viciously inclined ventures the ascent towards the place whence he descended" (Epist. 93).

2. By the voice of nature we understand the universal Providence of God or the influence of Divine Goodness which never ceases to work all in all things; that is to say, which continually develops each creature for the end to which it has been destined. For it is a sign of the divine wisdom to do nothing in vain, that is to say, without a definite end or without means proportionate to that end.

40
Whatever exists, therefore, exists for some end, and has been provided with the organs and appliances necessary to attain to it. It has also been gifted with a certain inclination, that nothing may be borne towards its end unwillingly and reluctantly, but rather promptly and pleasantly, by the natural instinct that pain and death will ensue if any obstacle be placed in the way. And so it is certain that man also is naturally fitted for the understanding of facts, for existence in harmony with the moral law, and above all things for the love of God (since for these we have already seen that he is destined), and that the roots of these three principles are as firmly planted in him as are the roots of any tree in the earth beneath it.

3. In order, therefore, that we may thoroughly understand the saying of the son of Sirach, that Wisdom has placed everlasting foundations in man (Ecclesiasticus i. 14), let us examine the foundations of Wisdom, of Virtue, and of Piety, which have been laid in us, that we may see what a marvellous instrument of wisdom man is.

4. It is evident that man is naturally capable of acquiring a knowledge of all things, since, in the first place, he is the image of God. For an image, if it be accurate, necessarily reproduces the outlines of its archetype, as otherwise it will not be an image. Now omniscience is chief among the properties of God, and it follows that the image of this must be reflected in man. And why not? Man, in truth, stands in the centre of the works of God and possesses a lucid mind, which, like a spherical mirror suspended in a room, reflects images of all things that are around it. All things that are around it, we say; for our mind not only seizes on things that are close at hand, but also on things that are far off, whether in space or in time; it masters difficulties, hunts out what is concealed, uncovers what is veiled, and wears itself out in examining what is inscrutable; so infinite and so unbounded is its power. If a thousand years were granted to man, in which, by grasping one thing after another, he might continually learn something fresh, he would still find some spot from which
the understanding might gain fresh objects of knowledge.

So unlimited is the capacity of the mind that in the process of perception it resembles an abyss. The body is enclosed by small boundaries; the voice roams within wider limits; the sight is bounded only by the vault of heaven; but for the mind, neither in heaven nor anywhere outside heaven, can a boundary be fixed. It ascends as far over the heavens above as below the depths beneath, and would do so if they were even a thousand times more vast than they are; for it penetrates through space with incredible speed. Shall we then deny that it can fathom and grasp all things?

5. Philosophers have called man a Microcosm or Epitome of the Universe, since he inwardly comprehends all the elements that are spread far and wide through the Macrocosm, or world at large; a statement the truth of which is shown elsewhere. The mind, therefore, of a man who enters this world is very justly compared to a seed or to a kernel in which the plant or tree really does exist, although its image cannot actually be seen. This is evident; since the seed, if placed in the ground, puts forth roots beneath it and shoots above it, and these, later on, by their innate force, spread into branches and leaves, are covered with foliage, and adorned with flowers and fruit. It is not necessary, therefore, that anything be brought to a man from without, but only that that which he possesses rolled up within himself be unfolded and disclosed, and that stress be laid on each separate element. Thus Pythagoras used to say that it was so natural for a man to be possessed of all knowledge, that a boy of seven years old, if prudently questioned on all the problems of philosophy, ought to be able to give a correct answer to each interrogation; since the light of Reason is a sufficient standard and measure of all things. Still it is true that, since the Fall, Reason has become obscure and involved, and does not know how to set itself free; while those who ought to have done so have rather entangled it the more.
6. To the rational soul, that dwells within us, organs of sense have been supplied, which may be compared to emissaries and scouts, and by the aid of these it compasses all that lies without. These are sight, hearing, smell, sound, and touch, and there is nothing whatever that can escape their notice. For, since there is nothing in the visible universe which cannot be seen, heard, smelt, tasted, or touched, and the kind and quality of which cannot in this way be discerned, it follows that there is nothing in the universe which cannot be compassed by a man endowed with sense and reason.

7. In addition to the desire for knowledge that is implanted in him, man is imbued not merely with a tolerance of but with an actual appetite for toil. This is evident in earliest childhood, and accompanies us throughout life. For who is there that does not always desire to see, hear, or handle something new? To whom is it not a pleasure to go to some new place daily, to converse with some one, to narrate something, or have some fresh experience? In a word, the eyes, the ears, the sense of touch, the mind itself, are, in their search for food, ever carried beyond themselves; for to an active nature nothing is so intolerable as ease and sloth. Even the fact that the ignorant admire learned men is but a sign that they feel the promptings of a certain natural desire. For they would wish themselves to be partakers of this wisdom, could they deem it possible. But, since they despair, they only sigh, and marvel at those whom they see in advance of them.

8. The examples of those who are self-taught show us most plainly that man, under the guidance of nature, can penetrate to a knowledge of all things. Many have made greater progress under their own tuition, or (as Bernard says) with oaks and beeches for their teachers, than others have done under the irksome instruction of tutors. Does not this teach us that, in very truth, all things exist in man; that the lamp, the oil, the tinder, and all the appliances are there, and that if only he be sufficiently skilled to strike sparks, to catch them, and to kindle the
lamp, he can forthwith see and can reap the fullest enjoyment of the marvellous treasures of God's wisdom, both in himself and in the larger world; that is to say, can appreciate the numerical and proportional arrangement of the whole creation. Now, when the internal lamp is not lit, but the torches of strange opinions are carried round without, the effect must be as if lights were carried round a man shut up in a dark dungeon; the rays indeed penetrate the chinks, but the full light is unable to enter. Thus, as Seneca says: "The seeds of all arts are implanted in us, and God the master brings forth intellect from the darkness."

9. The things to which our minds may be likened teach the same lesson. For the earth (with which the Scriptures often compare our heart) receives seeds of every description. One and the same garden can be sown with herbs, with flowers, and with aromatic plants of every kind, if only the gardener lack not prudence and industry. And the greater the variety, the pleasanter the sight to the eyes, the sweeter the attraction to the nose, and the more potent the refreshment to the heart. Aristotle compared the mind of man to a blank tablet on which nothing was written, but on which all things could be engraved. And, just as a writer can write or a painter paint whatever he wishes on a bare tablet, if he be not ignorant of his art, thus it is easy for one who is not ignorant of the art of teaching to depict all things on the human mind. If the result be not successful, it is more than certain that this is not the fault of the tablet (unless it have some inherent defect), but arises from ignorance on the part of the writer or painter. There is, however, this difference, that on the tablet the writing is limited by space, while, in the case of the mind, you may continually go on writing and engraving without finding any boundary, because, as has already been shown, the mind is without limit.

10. Again, the comparison of our brain, the workshop of thought, to wax which either receives the impress of a seal, or furnishes the material for small images, is an apt one. For just as wax, taking every form, allows itself to be
modelled and remodelled in any desired way, so the brain, receiving the images of all things, takes into itself whatever is contained in the whole universe. This comparison throws a remarkable light on the true nature of thought and of knowledge. Whatever makes an impression on my organ of sight, hearing, smell, taste, or touch, stands to me in the relation of a seal by which the image of the object is impressed upon my brain. So true is this simile that when the object is removed from my eyes, my ears, my nostrils, or my hand, its image still remains before me; nor is it possible that it should not remain, unless my attention has wandered and the impression has been a weak one. For example, if I have seen or spoken to any one; if, when taking a journey, I have seen a mountain, a river, a field, a wood, or a town, or if I have read anything attentively in some author, all these things are imprinted on the brain, so that, as often as the recollection of them comes into my mind, the effect is the same as if I were actually seeing them with my eyes, hearing them with my ears, tasting them, or feeling them. And although of these impressions the brain places one before the other or receives some more distinctly and vividly than others, it still, in some way or other, receives, represents, and retains them all.

11. Here we have mirrored before us the marvellous wisdom of God, who was able to arrange that the small mass of our brains should be sufficient to receive so many thousands of images. For, if the particulars can be remembered of anything that any of us (and this applies particularly to men of learning) have, many years before, seen, heard, tasted, read, or collected by experience or by reasoning, it is evident that these details must be carried in the brain. Yet it is a fact that images of objects formerly seen, heard, or read of, of which thousands of thousands and many more exist, and which are daily multiplied as we daily see, hear, read, or experience something new, are all carefully stored up. What inscrutable wisdom and power of God lies here? Solomon wonders that all rivers
run into the sea, and that yet the sea is not full (Eccles. i. 7), and who will not marvel at this abyss of memory which exhausts all things, which gives all back again, and yet is never overfull or too void? In truth our mind is greater than the universe, since that which contains is necessarily greater than that which is contained.

12. Finally, the eye (or a mirror) resembles the mind in many ways. If you hold anything before it, of whatever shape or colour, it will soon display a similar image in itself. That is to say, unless you are in the dark, or turn your back, or are too far off, at a distance greater than is fitting, or hinder the impression, or confuse it by movement; for in these cases it must be confessed that the result will be failure. I speak, therefore, of what takes place naturally, when light is present and the object is suitably placed. Just as, then, there is no need for the eye to be compelled to open and look at any object, since, naturally thirsting for light, it rejoices to be fed by gazing, and suffices for all objects (provided that it be not confused by too many at once), and just as it can never be satiated by seeing, so does the mind thirst for objects, ever longs and yearns to observe, grasps at, nay, seizes on all information, and is indefatigable, provided that it be not surfeited with an excess of objects, and that they be presented to its observation one after the other, and in the proper order.

13. Even the heathen philosophers saw that a harmony of morals was necessary for man, although, being ignorant of that other light granted by heaven, which is the most certain guide to eternal life, they set up these sparks as torches; a vain endeavour. Thus Cicero says: "The seeds of virtue are sown in our dispositions, and, if they were allowed to develope, nature herself would lead us to the life of the blest." This goes rather too far! "Now, however, from the time when we are brought forth to the light of day, we continually move in all wickedness, so that we almost seem to suck in faults with our nurse's milk" (Tuscul. iii.). Thus the truth of the statement that the seeds of virtue are born with man is bound up with this
twofold argument: (1) every man delights in harmony; (2) man himself, externally and internally, is nothing but a harmony.

14. That man delights in harmony and pursues it greedily, is obvious. For who does not take pleasure in a well-made man, an elegant horse, a beautiful portrait, or a charming picture? And what is the reason of this if not that the proportion of the parts and of the colours is a source of enjoyment? This pleasure of the eye is very natural. Again, who is not affected by music? and why? Because a harmony of voices makes a pleasing consonance. To whom does well-flavoured food not taste good? For the proper mixing of the flavours tickles the palate. Every man rejoices in moderate heat, in moderate cold, in the moderate inactivity or motion of the limbs. Why? if not because everything that is harmonised is congenial and lifegiving to nature, while everything that lacks moderation is hostile and harmful to her.

Even the virtues of others are a source of admiration to some people (for those devoid of them like them in others; though they may not imitate them, thinking good habits impossible to acquire when once vice has got the upper hand). Why then should not each man like them in himself? Surely we are blind if we do not recognise that we all have within us the roots of harmony.

15. Indeed, man is nothing but a harmony, both in respect of his body and of his mind. For, just as the great world itself is like an immense piece of clockwork put together with many wheels and bells, and arranged with such art that throughout the whole structure one part depends on the other, and the movements are perpetuated and harmonised; thus it is with man. The body is indeed constructed with wonderful skill. First of all comes the heart, the source of all life and action, from which the other members receive motion and the measurement of motion. The weight, the efficient cause of motion, is the brain, which by the help of the nerves, as of ropes, attracts and repels the other wheels or limbs, while the
variety of operations within and without depends on the commensurate proportion of the movements.

16. In the movements of the soul the most important wheel is the will; while the weights are the desires and affections which incline the will this way or that. The escapement is the reason, which measures and determines what, where, and how far anything should be sought after or avoided. The other movements of the soul resemble the less important wheels which depend on the principal one. Wherefore, if too much weight be not given to the desires and affections, and if the escapement, reason, select and exclude properly, it is impossible that the harmony and agreement of virtues should not follow, and this evidently consists of a proper blending of the active and the passive elements.

17. Man, then, is in himself nothing but a harmony, and, as in the case of a clock or of a musical instrument which a skilled artificer has constructed, we do not forthwith pronounce it to be of no further use if it become disorganised and corrupt (for it can be put to rights); thus, with regard to man, we may say that, no matter how disorganised by his fall into sin, he can, through the grace of God and by certain methods, be restored again to harmony.

18. That the roots of piety are present in man is shown by the fact that he is the image of God. For an image implies likeness, and that like rejoices in like, is an immutable law of nature (Eccles. xii. 7). Since, then, man's only equal is He in whose image he has been made, it follows that there is no direction in which he can be more easily carried by his desires than towards the fountain whence he took his origin; provided that he clearly understand the conditions of his existence.

19. The same thing is shown by the example of the moral philosophers, who, instructed by no word of God, but led by the blind instinct of nature, both acknowledged the Deity, venerated Him, and called upon His name, though they erred in the manner in which they put their
religion into practice. "All men have some conception of the gods, and all assign the highest place to a divine being," writes Aristotle (De Calo, i. 3). Seneca also says: "The worship of the gods consists first in believing in them; then in acknowledging their majesty and their goodness, without which no majesty exists; then in recognising that it is they who preside over the world, include everything under their dominion, and act as guardians of the human race" (Epist. 96). How closely this resembles what the Apostle says (Hebrews xi. 6): "He that Cometh to God must believe that he is, and that he is a rewarder of them that seek after him."

20. Plato also says: "God is the highest good, elevated high above all existence and above nature; towards which all creation strives" (Timaeus). And this is so true (that God is the highest good, which all things seek) that Cicero was able to say: "The first to teach us piety is nature" (De Natura Deorum, i.). And this is because (as Lactantius writes, bk. iv. ch. 28): "We receive pardon on condition that we give just and due worship to the God who produced us. Him alone let us know and follow. By this chain of piety we have been bound and linked to God, and it is from this fact that religion derives its name."

21. It must be confessed that the natural desire for God, as the highest good, has been corrupted by the Fall, and has gone astray, so that no man, of his strength alone, could return to the right way. But in those whom God illumines by the Word and by His Spirit it is so renewed, that we find David exclaiming: "Whom have I in heaven but thee? And there is none on earth that I desire beside thee. My flesh and my heart faileth, but God is the strength of my heart and my portion for ever" (Psalm lxxiii. 25, 26).

22. Therefore, while we are seeking for the remedies of corruption, let none cast corruption in our teeth. For God will remove it through His Holy Ghost and by the intervention of natural means. For as Nebuchadnezzar, when human reason was taken from him and the soul of a
beast was his, yet retained the hope of returning to his senses, and to his royal dignity as well, as soon as he acknowledged that heaven was his superior (Daniel iv. 25), so to us, who are trees rooted out of God's Paradise, the roots are left, and these can germinate afresh when the rain and the sun of God's grace are shed upon them. Did not God, soon after the Fall, and after the exile threatened to us (the penalty of death), sow in our hearts the seeds of fresh grace (by the promise of His blessed offspring)? Did He not send His Son to restore us to our former estate?

23. It is base, wicked, and an evident sign of ingratitude, that we continually complain of our corrupt state, but make no effort to reform it; that we bring forward what the old Adam can work in us, but never experience what the new Adam, Christ, can do. The Apostle says in his own name and in that of his Redeemer: "I can do all things through him that strengtheneth me" (Phil. iv. 13). If it be possible for a shoot grafted on a willow, on a thorn, or on any other shrub, to germinate and bear fruit, what would it not do if grafted on a stock similar to itself? See the argument of the Apostle (Romans xi. 24). In addition, if God is able from these stones to raise up children unto Abraham (Matthew iii. 9), why should He not be able to excite to good works man, the son of God from the first creation, adopted anew through Christ, and born again through the Spirit of grace?

24. Ah! let us beware lest we neglect the grace of God, which He is prepared to pour most liberally upon us. For if we, who are made one with Christ through faith, and dedicated to Him through the spirit of adoption, if we, I say, deny that we, with our offspring, are fit for those things which are of the kingdom of God, how was it that Christ said of children that theirs was the kingdom of heaven? or how can He refer us to them, bidding us to become as little children, if we wish to enter into the kingdom of heaven? (Matthew xviii. 3).

How is it that the Apostle pronounces the children of Christians to be sacred (even where one only of the parents
is faithful), and says that they are not unclean (1 Cor. vii. 14). Even of those who have been implicated in the gravest crimes the Apostle dares to affirm: "Such were some of you; but ye were washed, but ye were sanctified, but ye were justified in the name of the Lord Jesus Christ and in the Spirit of our God" (1 Cor. vi. 11). Can it therefore appear impracticable to any one, when we demand that the children of Christians (not the offspring of the old Adam but of the new, the sons of God, the little brothers and sisters of Christ) may be carefully trained, and declare that they are fit to receive in their hearts the seeds of eternity? We do not indeed demand fruit from a wild olive, but we come to the assistance of grafts freshly grafted on the tree of life, and help them to bear fruit.

25. We see, then, that it is more natural, and, through the grace of the Holy Spirit, easier for a man to become wise, honest, and righteous, than for his progress to be hindered by incidental depravity. For everything returns easily to its own nature, and this it is that the Scriptures say: "Truth is easily seen by those who love her, and can readily be found by those who seek her. She grants herself to the understanding, and those who wait before her door obtain her without trouble" (Wisdom vi. 13, 15). As the poet of Venusia says:

No one is so wild that he cannot be tamed,
If he patiently turn his ear to instruction and knowledge.
CHAPTER VI

IF A MAN IS TO BE PRODUCED, IT IS NECESSARY THAT HE BE FORMED BY EDUCATION

1. The seeds of knowledge, of virtue, and of piety are, as we have seen, naturally implanted in us; but the actual knowledge, virtue, and piety are not so given. These must be acquired by prayer, by education, and by action. He gave no bad definition who said that man was a "teachable animal." And indeed it is only by a proper education that he can become a man.

2. For, if we consider knowledge, we see that it is the peculiar attribute of God to know all things by a single and simple intuition, without beginning, without progress, and without end. For man and for angels this is impossible, because they do not possess infinity and eternity, that is to say, divinity. It is enough for them to have received sufficient keenness of intellect to comprehend the works of God, and to gather a wealth of knowledge from them. As regards angels, it is certain that they also learn by perception (1 Peter i. 12; Ephes. iii. 10; 1 Kings xxii. 20; Job i. 6), and that their knowledge, like our own, is derived from experience.

3. Let none believe, therefore, that any can really be a man, unless he have learned to act like one, that is, have been trained in those elements which constitute a man. This is evident from the example of all things created, which, although destined for man, do not suit his uses until fitted for them by his hands. For example, stones have
been given to us as material with which to build houses, towers, walls, pillars, etc.; but they are of no use until they are cut and laid in their place by us. Pearls and precious stones destined to adorn man must be cut, ground, and polished. The metals, which are of vital use in daily life, have to be dug out, melted, refined, and variously cast and hammered. Till this is done they are of less use to us than common earth.

From plants we derive food, drink, and medicines; but first the herbs and grains have to be sown, hoed, gathered, winnowed, and ground; trees have to be planted, pruned, and manured, while their fruits must be plucked off and dried; and if any of these things are required for medicine, or for building purposes, much more preparation is needed. Animals, whose essential characteristics are life and motion, seem to be self-sufficing, but if you wish to use them for the purposes for which they are suitable, some training is necessary. For example, the horse is naturally suited for use in war, the ox for drawing, the ass for carrying burdens, the dog for guarding and hunting, the falcon and hawk for fowling; but they are all of little use until we accustom them to their work by training.

4. Man, as far as his body is concerned, is born to labour; and yet we see that nothing but the bare aptitude is born in him. He needs instruction before he can sit, stand, walk, or use his hands. Why, therefore, should it be claimed for our mind that, of itself, it can exist in its full development, and without any previous preparation; since it is the law of all things created that they take their origin from nothing and develop themselves gradually, in respect both of their material and of the process of development? For it is well known, and we showed in our last chapter, that the angels, whose perfection comes very near to that of the Almighty, are not omniscient, but make gradual advances in their knowledge of the marvellous wisdom of God.

5. It is evident, too, that even before the Fall, a school in which he might make gradual progress was opened for
man in Paradise. For, although the first created, as soon as they came into being, lacked neither the power of walking erect, nor speech, nor reason, it is manifest, from the conversation of Eve with the serpent, that the knowledge of things which is derived from experience was entirely wanting. For Eve, had she had more experience, would have known that the serpent is unable to speak, and that there must therefore be some deceit.

Much more, therefore, in this state of corruption must it be necessary to learn by experience, since the understanding which we bring with us is an empty form, like a bare tablet, and since we are unskilled to do, speak, or know anything; for all these faculties do but exist potentially and need development. And indeed this is much more difficult now than it can have been in the state of perfection, since not only are things obscure, but tongues also are confused (so that instead of one, many must now be learned, if a man for the sake of learning wish to hold communion with divers people, living and dead). The vernacular tongues also have become more complex, and no knowledge of them is born with us.

6. Examples show that those who in their infancy have been seized by wild animals, and have been brought up among them, have not risen above the level of brutes in intellect, and would not have been able to make more use of their tongues, their hands, and their feet than beasts can, had they not once more come into the society of men. I will give several instances. About the year 1540, in a village called Hassia, situated in the middle of a forest, a boy three years of age was lost, through the carelessness of his parents. Some years afterwards the country people saw a strange animal running about with the wolves, of a different shape, four-footed, but with a man's face. Rumour of this spread through the district, and the governor asked the peasants to try to catch it alive and bring it to him. This they did, and finally the creature was conveyed to the Landgrave at Cassel.

When it was taken into the castle it tore itself away,
fled, and hid beneath a bench, where it glared fiercely at its pursuers and howled horribly. The prince had him educated and kept him continually in men's society, and under this influence his savage habits grew gentler by degrees; he began to raise himself up on his hind-legs and walk like a biped, and at last to speak intelligently and behave like a man. Then he related to the best of his ability how he had been seized and nurtured by the wolves and had been accustomed to go hunting with them. The story is found in M. Dresser's work on Ancient and Modern Education, and Camerarius, in his Hours, mentions the same case, and another one of a similar nature (bk. i. ch. 75).

Gulartius also (in Marvels of our Age) says that the following occurred in France in 1563. Some nobles went hunting, and, after they had killed twelve wolves, at last caught in their nets something like a naked boy, about seven years old, with a yellow skin and curly hair. His nails were hooked like an eagle's, he was unable to speak, and could only utter wild shrieks. When he was brought into the castle he struggled so fiercely that fetters could scarce be placed on him; but after a few days of starvation he grew gentler, and within seven months had commenced to speak. He was taken round to various towns and exhibited, and his masters made much money out of him. At length a certain poor woman acknowledged him as her son. So true is Plato's remark (Laws, i. 6): "Man is the gentlest and most divine being, if he have been made so by true education; but if he have been subjected to none or to a false one he is the most intractable thing in the world."

7. Education is indeed necessary for all, and this is evident if we consider the different degrees of ability. No one doubts that those who are stupid need instruction, that they may shake off their natural dulness. But in reality those who are clever need it far more, since an active mind, if not occupied with useful things, will busy itself with what is useless, curious, and pernicious; and, just as the more fertile a field is, the richer the crop of
thorns and of thistles that it can produce, so an excellent intelligence becomes filled with fanciful notions, if it be not sown with the seeds of wisdom and of virtue; and, just as a mill-stone grinds itself away with noise and grating, and often cracks and breaks, if wheat, the raw material of flour, be not supplied to it, so an active mind, if void of serious things, entangles itself utterly with vain, curious, and noxious thoughts, and becomes the cause of its own destruction.

8. What are the rich without wisdom but pigs stuffed with bran? What are the poor who have no understanding of affairs but asses laden with burdens? What is a handsome though ignorant man but a parrot adorned with feathers, or, as has been said, a golden sheath in which there is a leaden dagger?

9. For those who are in any position of authority, for kings, princes, magistrates, pastors of churches, and doctors, it is as necessary to be imbued with wisdom as it is for a guide to have eyes, an interpreter to have speech, a trumpet to be filled with sound, or a sword to have an edge. Similarly, those in subordinate positions should be educated that they may know how to obey their superiors wisely and prudently, not under compulsion, with the obedience of an ass, but of their own free will and from love of order. For a rational creature should be led, not by shouts, imprisonment, and blows, but by reason. Any other method is an insult to God, in whose image all men are made, and fills human affairs with violence and unrest.

10. We see then that all who are born to man’s estate have need of instruction, since it is necessary that, being men, they should not be wild beasts, savage brutes, or inert logs. It follows also that one man excels another in exact proportion as he has received more instruction. We may conclude this chapter with the words of the “Wise Man.” “He who deems wisdom and discipline of no avail is wretched; his hopes (of attaining his desire) are vain, his labour is fruitless, and his work idle” (Wisdom iii. 11).
CHAPTER VII

A MAN CAN MOST EASILY BE FORMED IN EARLY YOUTH, AND CANNOT BE FORMED PROPERLY EXCEPT AT THIS AGE

1. From what has been said it is evident that the circumstances of men and of trees are similar. For, as a fruit tree (an apple, a pear, a fig, or a vine) is able to grow from its own stock and of its own accord, while a wild tree will not bring forth sweet fruits until it be planted, watered, and pruned by a skilled gardener, so does a man grow of his own accord into a human semblance (just as any brute resembles others of his own class), but is unable to develope into a rational, wise, virtuous, and pious creature, unless virtue and piety are first engrafted in him. We will now show that this must take place while the plants are young.

2. From the human point of view there are six reasons for this. First, the uncertainty of our present life. For that we must leave it is certain, but when and how is uncertain. And that any should be snatched away unprepared is a danger greatly to be dreaded, since a man is thus doomed eternally. For, just as a man must go through life without a limb if he leave his mother's womb bereft of it, so, if, when we leave this world, our minds have not been moulded to the knowledge of and participation in God, there will be no further opportunity given us. And therefore, as the matter is of such importance, the greatest haste is necessary, lest any man be lost.

3. And although death be far off and a long life be
assured, the formation of character should none the less begin early, because life must be spent not in learning but in acting. We should therefore be prepared for the actions of life as soon as possible, since we may be compelled to desist from action before we have learned our lesson properly. Indeed, if any wish to devote his life to learning, the multitude of objects which the Creator has placed before his happy gaze is infinite, and, if he chance to have a life like Nestor's, he will find his most useful occupation in discerning the treasures of divine wisdom that the Creator has provided, and in thus preparing for himself the bulwarks of a happy life. Man's senses, therefore, must be early brought to bear on the world that surrounds him, since throughout his whole life he has much to learn, to experience, and to accomplish.

4. It is the nature of everything that comes into being, that while tender it is easily bent and formed, but that, when it has grown hard, it is not easy to alter. Wax, when soft, can be easily fashioned and shaped; when hard it cracks readily. A young plant can be planted, transplanted, pruned, and bent this way or that. When it has become a tree these processes are impossible. New-laid eggs, when placed under a hen, grow warm quickly and produce chickens; when they are old they will not do so. If a rider wish to train a horse, a ploughman an ox, a huntsman a dog or a hawk, a bear-leader a bear for dancing, or an old woman a magpie, a raven, or a crow, to imitate the human voice, they must choose them for the purpose when quite young; otherwise their labour is wasted.

5. It is evident that this holds good with man himself. His brain, which we have already compared to wax, because it receives the images of external objects that present themselves to its organs of sense, is, in the years of childhood, quite wet and soft, and fit for receiving all images that come to it. Later on, as we find by experience, it grows hard and dry by degrees, so that things are less readily impressed or engraved upon it. Hence Cicero's remark,
"Boys pick up countless things with rapidity." In the same way it is only in the years of boyhood, when the muscles are still capable of being trained, that the hands and the other members can be trained to produce skilled work. If a man is to become a good writer, painter, tailor, smith, cabinet-maker, or musician, he must apply himself to the art from his early youth, when the imagination is active and the fingers flexible: otherwise he will never produce anything. If piety is to take root in any man's heart, it must be engrafted while he is still young; if we wish any one to be virtuous, we must train him in early youth; if we wish him to make great progress in the pursuit of wisdom, we must direct his faculties towards it in infancy, when desire burns, when thought is swift, and when memory is tenacious. "An old man who has still to learn his lessons is a shameful and ridiculous object; training and preparation are for the young, action for the old" (Seneca, Epist. 36).

6. In order that man may be fashioned to humanity, God has granted him the years of youth, which are unsuitable for everything but education. While the horse, the ox, the elephant, and other beasts, mere animated masses, come to maturity in a few years, man alone scarcely does so in twenty or thirty. Now, if any imagine that this arises from chance or from some accidental cause or other, he surely betrays his folly. To all other things, forsooth, God has meted out their periods, while in the case of man alone, the lord of all, He allows them to be fixed by chance! Or are we to suppose that nature finds it easier to complete the formation of man by slow processes? Nature, who with no trouble can produce vaster bodies in a few months. We can only suppose, therefore, that the Creator, of deliberate intent, interposed the delay of youth, in order that our period of training might be longer; and ordained that for some time we should take no part in the action of life, that, for the rest of our lives, and for eternity, we might be the more fitted to do so.

7. In man, that alone is lasting which has been imbibed in early youth, as is clear from the same examples. A jar,
even though broken, preserves the odour with which it was imbued when new. When a tree is young its branches spread out all round it, and remain in this position for hundreds of years, until it is cut down. Wool is so tenacious of the colour with which it is first dyed, that it cannot be bleached. The wooden hoop of a wheel, which has been bent into a curve, will break into a thousand pieces rather than return to straightness. And similarly, in a man, first impressions cling so fast that nothing but a miracle can remove them. It is therefore most prudent that men be shaped to the standard of wisdom in early youth.

8. Finally, it is most dangerous if a man be not imbued with the cleanly precepts of life from his very cradle. For, when the external senses begin to fulfil their functions, the mind of man cannot remain at rest, and, if not engaged with what is useful, it occupies itself with the vainest and even with harmful things (a process which is assisted by the evil examples of a corrupt age), while later on, if it wish to unlearn what it has acquired, it finds this impossible or very difficult; as we have already shown. Hence the world is full of enormities which neither the civil magistrates nor the ministers of the Church are able to quell, since no serious attention is given to the source from which the evil flows.

9. If, then, each man have the welfare of his own children at heart, and if that of the human race be dear to the civil and ecclesiastical guardians of human affairs, let them hasten to make provision for the timely planting, pruning, and watering of the plants of heaven, that these may be prudently formed to make prosperous advances in letters, virtue, and piety.
CHAPTER VIII

THE YOUNG MUST BE EDUCATED IN COMMON, AND FOR THIS SCHOOLS ARE NECESSARY

1. Having shown that those plants of Paradise, Christian children, cannot grow up like a forest, but need tending, we must now see on whom this care should fall. It is indeed the most natural duty of parents to see that the lives for which they are responsible shall be rational, virtuous, and pious. God Himself bears witness that this was Abraham’s custom, when He says: “For I have known him, to the end that he may command his children and his household after him, that they may keep the way of the Lord, to do justice and judgment” (Gen. xviii. 19). He demands it from parents in general, with this command: “And these words, which I command thee this day, shall be upon thine heart, and thou shalt teach them diligently unto thy children, and shall talk of them when thou sittest in thine house, and when thou walkest by the way, and when thou liest down, and when thou risest up” (Deut. vi. 7). By the Apostle also He says: “And ye fathers, provoke not your children to wrath, but nurture them in the chastening and admonition of the Lord” (Ephes. vi. 4).

2. But, since human occupations as well as human beings have multiplied, it is rare to find men who have either sufficient knowledge or sufficient leisure to instruct their children. The wise habit has therefore arisen of giving over children, for their common education, to select
persons, conspicuous for their knowledge of affairs and their sobriety of morals. To such instructors of the young the name of preceptor, master, schoolmaster, or professor has been applied, while the places destined for this common instruction have been named schools, elementary schools, lecture-rooms, colleges, public schools, and universities.

3. On the authority of Josephus we learn that the patriarch Shem opened the first school, just after the flood. Later, this was called the Hebrew school. Who does not know that in Chaldaea, especially in Babylon, there were many schools, in which the arts, including astronomy, were cultivated? since, later on (in the time of Nebuchadnezzar), Daniel and his companions were instructed in the wisdom of the Chaldaens (Dan. i. 20), as was also the case with Moses in Egypt (Acts vii. 22). By the command of God, schools were set up in all the towns of the children of Israel; they were called synagogues, and in them the Levites used to teach the law. These lasted till the coming of Christ, and became renowned through His teaching and that of His Apostles. The custom of erecting schools was borrowed by the Romans from the Egyptians, the Greeks, and the Jews, and from the Romans it spread throughout their whole empire, especially when the religion of Christ became universal through the care of pious princes and bishops. History relates that Charlemagne, whenever he subjected any heathen race, forthwith ordained for it bishops and learned men, and erected churches and schools; and after him the other Christian emperors, kings, nobles, and magistrates have increased the number of schools so much that they are innumerable.

4. It is to the interest of the whole Christian republic that this Godly custom be not only retained but increased as well, and that in every well-ordered habitation of man (whether a city, a town, or a village), a school or place of education for the young be erected. This is demanded:—

5. (i.) By the admirable method of transacting business
which is in common use. For, as the head of a household makes use of various craftsmen when he has no leisure time to prepare what is necessary for his household economy, why should he make any difference in the case of education? When he needs flour, he goes to the miller; when flesh, to the butcher; when drink, to the inn-keeper; when clothing, to the tailor; when shoes, to the cobbler; when a house, a ploughshare, or a key, to the builder, the smith, or the locksmith. Again, we have churches for religious instruction, and law courts and assembly rooms in which to discuss the causes of litigants and make weighty announcements to the assembled people; why not schools also for the young? Farmers do not feed their own pigs and cows, but keep hired herdsmen who feed them all at one time, while their masters, free from distraction, transact their own business. For this is a marvellous saving of labour, when one man, undisturbed by other claims on his attention, confines himself to one thing; in this way one man can be of use to many, and many to one man.

6. (ii.) By necessity, because it is very seldom that parents have sufficient ability or sufficient leisure to teach their children. The consequence is that there has arisen a class of men who do this one thing alone, as a profession, and that by this means the advantage of the whole community is attained.

7. (iii.) And although there might be parents with leisure to educate their own children, it is nevertheless better that the young should be taught together and in large classes, since better results and more pleasure are to be obtained when one pupil serves as an example and a stimulus for another. For to do what we see others do, to go where others go, to follow those who are ahead of us, and to keep in front of those who are behind us, is the course of action to which we are all most naturally inclined.

It is when the steed has rivals to surpass or leaders to follow, That he runs his best.

Young children, especially, are always more easily led
and ruled by example than by precept. If you give them a precept, it makes but little impression; if you point out that others are doing something, they imitate without being told to do so.

8. (iv.) Again, nature is always showing us by examples that whatever is to be produced in abundance must be produced in some one place. Thus, for instance, wood is produced in quantities in forests, grass in fields, fish in lakes, and metals in the bowels of the earth.

Specialisation, too, is carried to such an extent, that the forest which produces pines, cedars, or oaks, produces them in abundance, although other kinds of trees may be unable to grow there; and, in the same way, land that produces gold does not produce other metals in like quantity. This truth can be seen much more plainly in our own bodies. It is very important that each limb share in the nourishment that is assimilated by the body. Its share, however, is not transmitted to each in its raw state, to be there digested and adapted; but there are certain fixed members, designed as workshops for the performance of this function, namely, to receive food for the use of the whole body, to heat it, to digest it, and, at length, to distribute nourishment to the other members. Thus, chyle is produced by the stomach, blood by the liver, vital spirit by the heart, and mental spirit by the brain: and these elements, when prepared, are properly diffused throughout all the limbs and preserve life in the whole body. And therefore, as workshops supply manufactured goods, churches supply piety, and law courts justice, why should not schools produce, purify, and multiply the light of wisdom, and distribute it to the whole body of the human community?

9. (v.) And, finally, we see the same tendency in the arts, if a rational procedure be used. When a tree cultivator, in his walks through woods and thickets, finds a sapling suitable for transplanting, he does not plant it in the same place where he finds it, but digs it out and places it in an orchard, where he cares for it in company with a hundred others. And thus also, the man who breeds fishes for the
kitchen, digs fish-ponds and allows thousands to multiply together. In these cases the larger the orchard the better grow the trees, and the larger the fish-pond the larger grow the fish. And therefore, as fish-ponds are dug for fish and orchards are laid out for fruit-trees, so also should schools be erected for the young.
CHAPTER IX

ALL THE YOUNG OF BOTH SEXES SHOULD BE SENT TO SCHOOL

1. The following reasons will establish that not the children of the rich or of the powerful only, but of all alike, boys and girls, both noble and ignoble, rich and poor, in all cities and towns, villages and hamlets, should be sent to school.  

2. In the first place, all who have been born to man’s estate have been born with the same end in view, namely, that they may be men, that is to say, rational creatures, the lords of other creatures, and the images of their Creator. All, therefore, must be brought on to a point at which, being properly imbued with wisdom, virtue, and piety, they may usefully employ the present life and be worthily prepared for that to come. God Himself has frequently asserted that with Him there is no respect of persons, so that, if, while we admit some to the culture of the intellect, we exclude others, we commit an injury not only against those who share the same nature as ourselves, but against God Himself, who wishes to be acknowledged, to be loved, and to be praised by all upon whom He has impressed His image. In this respect the fervour of all men will increase in proportion to the flame of knowledge that has been kindled. For our love is in direct ratio to our knowledge.

3. Now we do not know to what uses divine providence has destined this or that man; but this is certain, that out of the poorest, the most abject, and the most obscure, He
has produced instruments for His glory. Let us, therefore, imitate the sun in the heavens, which lights, warms, and vivifies the whole earth, so that whatever is able to live, to flourish, and to blossom, may do so.

4. Nor is it any obstacle that some seem to be naturally dull and stupid, for this renders more imperative the universal culture of such intellects. The slower and the weaker the disposition of any man, the more he needs assistance, that he may throw off his brutish dulness and stupidity as much as possible. Nor can any man be found whose intellect is so weak that it cannot be improved by culture. A sieve, if you continually pour water through it, grows cleaner and cleaner, although it cannot retain the liquid; and, in the same way, the dull and the weak-minded, though they may make no advance in letters, become softer in disposition and learn to obey the civil magistrates and the ministers of the Church. There have, besides, been many instances in which those who are naturally stupid have gained such a grasp of the sciences as to excel those who were more gifted. As the poet truly says: "Industry overcomes all obstacles." Again, just as some men are strong as children, but afterwards grow sick and ailing, while others, whose bodies are sickly and undersized in youth, develope into robust and tall men; so it is with intellects. Some develope early, but soon wear out and grow dull, while others, originally stupid, become sharp and penetrating. In our orchards we like to have not only trees that bring forth early fruit, but also those that are late-bearing; for each thing, as says the son of Sirach, finds praise in its season, and at length, though late, shows that it has not existed in vain. Why, therefore, should we wish that in the garden of letters only one class of intellects, the forward and active, should be tolerated? Let none be excluded unless God has denied him sense and intelligence.

5. Nor can any sufficient reason be given why the weaker sex (to give a word of advice on this point in particular) should be altogether excluded from the pursuit of knowledge (whether in Latin or in their mother-tongue).
They also are formed in the image of God, and share in His grace and in the kingdom of the world to come. They are endowed with equal sharpness of mind and capacity for knowledge (often with more than the opposite sex), and they are able to attain the highest positions, since they have often been called by God Himself to rule over nations, to give sound advice to kings and princes, to the study of medicine and of other things which benefit the human race, even to the office of prophesying and of inveighing against priests and bishops. Why, therefore, should we admit them to the alphabet, and afterwards drive them away from books? Do we fear their folly? The more we occupy their thoughts, so much the less will the folly that arises from emptiness of mind find a place.

6. But let not all books be given to them indiscriminately, as they have been given to the young of the other sex (and indeed it is greatly to be deplored that more caution has not been displayed in this matter); but only those from which, by the due observation of God and of His works, true virtue and true piety can be learned.

7. And let none cast in my teeth that saying of the Apostle: "I permit not a woman to teach" (1 Tim. ii. 12), or that of Juvenal in the sixth satire: "See that thy lawful wife be not a chatterbox, that she express not the simplest matter in involved language, nor be deeply versed in history," or the remark of Hippolytus in Euripides: "I detest a blue-stocking. May there never be a woman in my house who knows more than is fitting for a woman to know. For 'tis in the wise especially that Cypris engenders the desire for evil." These opinions, I opine, stand in no true opposition to our demand. For we are not advising that women be educated in such a way that their tendency to curiosity shall be developed, but so that their sincerity and contentedness may be increased, and this chiefly in those things which it becomes a woman to know and to do; that is to say, all that enables her to look after her household and to promote the welfare of her husband and her family.

8. If any ask, "What will be the result if artisans,
rustics, porters, and even women become lettered?” I answer, If this universal instruction of youth be brought about by the proper means, none of these will lack the material for thinking, choosing, following, and doing good things. All will know how the actions and endeavours of life should be regulated, within what limits we must progress, and how each man can protect his own position. Not only this, but all will regale themselves, even in the midst of their work and toil, by meditation on the words and works of God, and, by the constant reading of the Bible and other good books, will avoid that idleness which is so dangerous to flesh and blood. To sum up, they will learn to see, to praise, and to recognise God everywhere, and, in this way, to go through this life of care with enjoyment, and to look for the life to come with increased desire and hope. Does not such a condition of the Church represent to us the only paradise that it is possible to realise on this earth?
CHAPTER X

THE INSTRUCTION GIVEN IN SCHOOLS SHOULD BE UNIVERSAL

1. We have already shown that every one ought to receive a universal education, and this at school. But do not, therefore, imagine that we demand from all men a knowledge (that is to say, an exact or deep knowledge) of all the arts and sciences. This would neither be useful of itself, nor, on account of the shortness of life, can it be attained by any man. For we see that each science is so vast and so complicated (as are physics, arithmetic, geometry, astronomy, or even agriculture and arboriculture) that it would occupy the lifetime of even the strongest intellects if they wished to master it thoroughly by investigation and experiment. Thus did Pythagoras devote himself to arithmetic, Archimedes to mechanics, Agricola to metallurgy, and Longolius (who spent his whole life in endeavouring to acquire a perfect Ciceronian style) to rhetoric. It is the principles, the causes, and the uses of all the most important things in existence that we wish all men to learn; all, that is to say, who are sent into the world to be actors as well as spectators. For we must take strong and vigorous measures that no man, in his journey through life, may encounter anything so unknown to him that he cannot pass sound judgment upon it and turn it to its proper use without serious error.

2. We must, therefore, concentrate our energies on
obtaining that, throughout our whole lives, in schools and by the aid of schools: (i.) our talents may be cultivated by study of the sciences and of the arts; (ii.) languages may be learned; (iii.) honest morals may be formed; (iv.) God may be sincerely worshipped.

3. He spoke wisely who said that schools were the workshops of humanity, since it is undoubtedly through their agency that man really becomes man, that is to say (to refer to our previous analysis): (i.) a rational creature; (ii.) a creature which is lord over all creatures and also over himself; (iii.) a creature which is the delight of his Creator. This will be the case if schools are able to produce men who are wise in mind, prudent in action, and pious in spirit.

4. These three principles, then, must be implanted in all the young in all schools, and this I shall prove, starting from the following fundamental points:—
   (i.) From the circumstances by which we are surrounded;
   (ii.) From ourselves;
   (iii.) From Christ the God-man, the most perfect example of our perfection.

5. Things themselves, as far as they concern us, can be divided into three classes only: (i.) objects that we can observe, such as the heavens, the earth, and all that is in them; (ii.) objects that we can imitate, such as the marvellous order which pervades all things, and which man ought to imitate in his actions; (iii.) objects that we can enjoy, such as the grace of God and His manifold blessing here and for eternity. If man is to acquit himself creditably when brought into contact with this order of nature, he must be trained to know the things that are spread out for his observation in this marvellous amphitheatre, to do the things that it is right for him to do, and, finally, to enjoy those things of which the most benign Creator, treating him as a guest in His house, has, with liberal hand, given him the fruition.

6. If we consider ourselves, we see clearly that learning, virtue, and piety are of importance to all alike; whether we
look at the essential being of the soul, or at the object of our creation and introduction into the world.

7. The soul in its essential elements consists of three potentialities, which recall the uncreated Trinity, and these are the intellect, the will, and the memory. The province of the intellect is to observe the differences between things, even down to the smallest details. The will concerns itself with choice—that is to say, with the choice of things that are advantageous and the rejection of those which are not. The memory stores up for future use all the things with which the intellect and the will have been busied, and reminds the soul of its dependence on God and of its duty; in which aspect it is also called conscience.

In order, then, that these faculties may rightly fulfil their offices, it is necessary that they be furnished with such things as may illumine the intellect, direct the will, and stimulate the conscience, so that the intellect may be acute and penetrating, the will may choose without error, and the conscience may greedily refer all things to God. Therefore, just as these faculties (the intellect, the will, and the conscience) cannot be separated, since they constitute the same soul, so it is impossible to separate those three ornaments of the soul, erudition, virtue, and piety.

8. Now, if we consider why we have been sent into the world, it will be evident from two points of view that the object is threefold, namely, that we may serve God, His creatures, and ourselves, and that we may enjoy the pleasure to be derived from God, from His creatures, and from ourselves.

9. If we wish to serve God, our neighbours, and ourselves, it is necessary for us to possess, with respect to God, piety; with respect to our neighbours, virtue; and with respect to ourselves, knowledge. These principles, however, are intimately connected, and a man, for his own advantage, should be not only learned, but also virtuous and pious; for that of his neighbour, not only virtuous, but also learned and pious; and for the glory of God, not only pious, but also learned and virtuous.
10. If we consider the happiness to which God has destined mankind, we find that He showed His intention clearly when creating man, since He introduced him into a world furnished with all good things; prepared for him, in addition, a paradise of delights; and, finally, arranged to make him a partner of His eternal happiness.

11. Now, by the term "happiness" we understand not the pleasures of the body (though these, since they consist of the vigour of good health, and of the enjoyment of food and of sleep, can only arise from the virtue of temperance), but those of the soul, which arise either out of the objects around us, or from ourselves, or, finally, from God.

12. The pleasure which arises out of things themselves, is the pleasure that a wise man experiences in speculation. For, wherever he betakes himself, whatever he observes, and whatever he considers, he finds everywhere such attractions, that often, as it were, snatched out of himself, he merges his identity in them. It is to this that the book of Wisdom refers: "The conversation of wisdom hath no bitterness; and to live with her hath no sorrow, but mirth and joy" (viii. 16). And a heathen philosopher says: "There is nothing in life more pleasant than to seek out wisdom."

13. Pleasure in self is that very sweet delight which arises when a man, who is given over to virtue, rejoices in his own honest disposition, since he sees himself prompt to all things which the order of justice requires. This pleasure is far greater than the former one, according to the proverb "A good conscience is a perpetual feast."

14. Delight in God is the highest point to which pleasure can attain in this life, and is found when a man, feeling that God is eternally gracious to him, exults in His fatherly and immutable favour to such a degree that his heart melts with the love of God. He desires to know or to do nothing further, but, overwhelmed by God's mercy, he rests in peace and tastes the joys of eternal life. This is "the peace of God which passeth all understanding" (Phil. iv. 7), than which nothing more sublime can be desired or imagined.
These three principles, therefore, learning, virtue, and piety, are the three founts from which all the streams of the most perfect pleasures flow.

15. Lastly, God Himself, manifest in the flesh (that He might exhibit in Himself the perfection of all things), has taught by His example that these three elements must exist in each individual. For the Evangelist testifies that He advanced not only in stature, but also in wisdom and favour with God and man (Luke ii. 52). Here can be seen the blessed Trinity that adorns us. For what is wisdom but the knowledge of things as they are? What is it that brings us favour with men, if not amiability of character? What procures us the grace of God, if not the fear of the Lord, that is to say, inward, serious, and fervid piety? Let us, therefore, realise in ourselves that which we have seen in Jesus Christ, the absolute ideal of all perfection, the standard set up for us to imitate.

16. For this reason He said, "Learn of me" (Matt. xi. 29). And since this same Christ has been given to the human race as the most learned teacher, as the most holy priest, and as the most powerful king, it is evident that Christians should be formed on His model and should be enlightened through their intellects, sanctified through their consciences, and made powerful through their deeds (each in his own calling). Our schools, therefore, will then at length be Christian schools when they make us as like to Christ as is possible.

17. It is, therefore, an unhallowed separation if these three elements be not bound together as if by an adamantine chain. How wretched is the teaching, that does not lead to virtue and to piety! For what is literary skill without virtue? He who makes progress in knowledge but not in morality (says an old proverb), recedes rather than advances. And thus, what Solomon said of the beautiful but foolish woman, holds good of the learned man who possesses not virtue: "As a jewel of gold in a swine's snout, so is a fair woman which is without discretion" (Prov. xi. 22). For, just as gems are set not in
lead but in gold, in which combination both are more beautiful, thus should knowledge be joined not to immorality but to virtue, when each will add adornment to the other. For the fear of the Lord, as it is the beginning and the end of wisdom, is also the coping-stone and crown of knowledge. The fear of the Lord is the beginning of wisdom (Prov. i. and elsewhere).

18. Since, therefore, a man's whole life depends on the instruction that he has received during boyhood, every opportunity is lost unless the minds of all are then prepared for every emergency that may arise in life. Just as in his mother's womb each man receives his full complement of limbs,—hands, feet, tongue, etc.—although all men are not to be artificers, runners, scribes, or orators; so at school all men should be taught whatever concerns man, though in after life some things will be of more use to one man, others to another.
CHAPTER XI

HITHERTO THERE HAVE BEEN NO PERFECT SCHOOLS

1. This confident heading may seem too presumptuous; but I challenge the facts themselves, and, while I constitute the reader as judge, will myself do nothing but summon witnesses. I call a school that fulfils its function perfectly, one which is a true forging-place of men; where the minds of those who learn are illuminated by the light of wisdom, so as to penetrate with ease all that is manifest and all that is secret (comp. Wisdom vii. 21), where the emotions and the desires are brought into harmony with virtue, and where the heart is filled with and permeated by divine love, so that all who are handed over to Christian schools to be imbued with true wisdom may be taught to live a heavenly life on earth; in a word, where all men are taught all things thoroughly.

2. But has any school either existed on this plane of perfection or held this goal in view; not to ask if any has ever reached it? Lest I should seem to chase Platonic ideas and to dream of perfection such as exists nowhere and cannot be hoped for in this life, I will point out by another argument that such schools ought to be and have never yet existed.

3. Dr. Luther, in his exhortation to towns of the empire on behalf of the erection of schools (A.D. 1525), asks for these two things, among others. Firstly, that schools may be founded in all cities, towns, and villages, for the instruction of all the young of both sexes (the
necessity of which we proved in chap. ix.), so that even peasants and artisans may, for two hours daily, receive instruction in useful knowledge, in morality, and in religion. Secondly, that an easier method of instruction may be introduced, so that students, instead of developing an antipathy towards learning, may be enticed by irresistible attractions, and that, as he says, boys may gain no less pleasure from study than from spending whole days in playing ball and amusing themselves. These are the views of Dr. Luther.

4. This is indeed a noble counsel, and worthy of such a man! But who does not see that matters have gone no farther than his wish? For where are those universal schools, where is that attractive method?

5. It is evident that nothing has been done, since in the smaller villages and hamlets no schools have been founded.

6. Where schools exist, they are not for the whole community, but only for the rich, since, owing to their cost, the poor cannot gain admission to them, except by some chance, such as pity on the part of some one. Among those excluded there are probably some excellent intellects, which are thus ruined and destroyed, to the great loss of the Church and of the state.

7. Further, the method used in instructing the young has generally been so severe that schools have been looked on as terrors for boys and shambles for their intellects, and the greater number of the students, having contracted a dislike for learning and for books, have hastened away to the workshops of artificers or to some other occupation.

8. On the other hand, those who remained at school (whether compelled to do so by parents and guardians, or influenced by the hope of obtaining some honourable position by means of their attainments, or drawn towards the liberal arts spontaneously and of their own nature) did not receive a serious or comprehensive education, but a preposterous and wretched one. For piety and virtue, which form the most important element in education, were
neglected more than anything else. In all the schools (and even in the universities, which ought to embody the greatest advances of human culture) these subjects held only a secondary place, so that for the most part, instead of tractable lambs, fiery wild asses and restive mules were produced; and instead of characters moulded to virtue, nothing issued from the schools but a spurious veneer of morality, a fastidious and exotic clothing of culture, and eyes, hands, and feet trained to worldly vanities. How few of these mannikins, who had for so long been polished by such a training in the languages and in the arts, realised that to the rest of the world they ought to be an example of temperance, charity, humility, humanity, gravity, patience, and continence!

The reason of this evidently is that the question of "virtuous living" is never raised in the schools. This is shown by the wretched discipline in nearly all schools, by the dissolute morals of all classes, and by the never-ceasing complaints, sighs, and tears of pious men. Can any one defend the condition in which our schools have been? An hereditary disease, sprung from our first parents, pervades all classes, so that, shut out from the tree of life, we direct our desires inordinately towards the tree of knowledge, and our schools also, permeated by this insatiable appetite, have hitherto pursued nothing but intellectual progress.

9. But with what method or with what success have they done even this? In truth, the only result achieved was the following. For five, ten, or more years they detained the mind over matters that could be mastered in one. What could have been gently instilled into the intellect, was violently impressed upon it, nay rather stuffed and flogged into it. What might have been placed before the mind plainly and lucidly, was treated of obscurely, perplexedly, and intricately, as if it were a complicated riddle.

10. In addition, though for the present we will pass this over, the intellect was scarcely ever nourished by the
actual facts, but was filled with the husks of words, with a windy and parrot-like loquacity, and with the chaff of opinions.

11. The study of the Latin language alone (to take this subject as an example), good heavens! how intricate, how complicated, and how prolix it was! Camp followers and military attendants, engaged in the kitchen and in other menial occupations, learn a tongue that differs from their own, sometimes two or three, quicker than the children in schools learn Latin only, though children have abundance of time, and devote all their energies to it. And with what unequal progress! The former gabble their languages after a few months, while the latter, after fifteen or twenty years, can only put a few sentences into Latin with the aid of grammars and of dictionaries, and cannot do even this without mistakes and hesitation. Such a disgraceful waste of time and of labour must assuredly arise from a faulty method.

12. On this subject the celebrated Eilhard Lubinus, professor in the University of Rostock, has with justice remarked: "When I consider the ordinary method of teaching boys in schools, it seems to me as if it had been laboriously devised with a view to make it impossible for teachers and pupils alike to lead or to be led to a knowledge of the Latin tongue, without great labour, great tedium, infinite trouble, and the greatest possible consumption of time. A state of things which I cannot think of without shuddering." And a little farther on: "After frequent consideration of these matters I find myself always led to the conclusion, that the entire system must have been introduced into schools by some evil and envious genius, the enemy of the human race." So says Lubinus, who is only one out of many authorities whom I could quote in my favour.

13. But what need is there of witnesses? How many of us there are who have left the schools and universities with scarcely a notion of true learning! I, unfortunate man that I am, am one of many thousands, who have
miserably lost the sweetest spring-time of their whole life, and have wasted the fresh years of youth on scholastic trifles. Ah, how often, since my mind has been enlightened, has the thought of my wasted youth wrung sighs from my breast, drawn tears from my eyes, and filled my heart with sorrow! How often has my grief caused me to exclaim:

Oh that Jupiter could bring back to me the years that are past and gone!

14. But these prayers are in vain. Bygone days will never return. None of us who is advanced in years can grow young again, commence his career anew, and, furnished with a better method, pursue it more successfully. Of this there is no question. One thing alone does remain, and that is to give those who come after us such advice as we can. By showing how it was that our masters led us into error we shall be able to point out the way in which such errors may be avoided.
CHAPTER XII

IT IS POSSIBLE TO REFORM SCHOOLS

1. To cure deep-seated maladies is difficult and often well-nigh impossible. But if any one offer an efficacious remedy, does the sick man reject his services? Does he not rather wish to obtain aid as quickly as possible, and especially if he think that the physician is guided not by mere opinion but by solid reason? We, at any rate, in this our undertaking, have reached the point at which we must make plain (1) what we actually promise, and (2) on what principles we intend to proceed.

2. We promise, then, such a system of education that
   (i.) All the young shall be educated (except those to whom God has denied understanding).
   (ii.) And in all those subjects which are able to make a man wise, virtuous, and pious.
   (iii.) That the process of education, being a preparation for life, shall be completed before maturity is reached.
   (iv.) That this education shall be conducted without blows, rigour, or compulsion, as gently and pleasantly as possible, and in the most natural manner (just as a living body increases in size without any straining or forcible extension of the limbs; since if food, care, and exercise are properly supplied, the body grows and becomes strong, gradually, imperceptibly, and of its own accord. In the same way I maintain that nutriment, care, and exercise, prudently supplied to the mind, lead it naturally to wisdom, virtue, and piety).
(v.) That the education given shall be not false but real, not superficial but thorough; that is to say, that the rational animal, man, shall be guided, not by the intellects of other men, but by his own; shall not merely read the opinions of others and grasp their meaning or commit them to memory and repeat them, but shall himself penetrate to the root of things and acquire the habit of genuinely understanding and making use of what he learns.

(vi.) That this education shall not be laborious but very easy. The class instruction shall last only four hours each day, and shall be conducted in such a manner that one master may teach hundreds of pupils at the same time, with ten times as little trouble as is now expended on the teaching of one.

3. But who will have faith in these things before he see them? It is a well-known peculiarity of men that before a remarkable discovery is made they wonder how it can be possible, while after its achievement they are surprised that it was not discovered before. When Archimedes undertook for King Hiero to move down to the sea with one hand an immense ship that a hundred men were not able to stir, his proposal was received with laughter; but its accomplishment was viewed with stupefaction.

4. When Columbus suspected that there were new islands in the west, no one, with the exception of the King of Castille, was willing to hear him or give him any assistance towards making the experiment. It is related that his very companions on the voyage, in despair at their frequent disappointments, were within a little of throwing him into the sea and returning with their task unfulfilled. But, in spite of all, that vast new continent was discovered, and now we all wonder how it could have remained so long unknown. That well-known jest of Columbus illustrates the same point. For when, at a banquet, some Spaniards, who were envious that an Italian should have the glory of such a discovery, began to mock him, and tauntingly said that the other hemisphere had been discovered not by skill but by chance, and could have been
just as easily discovered by anybody else, he proposed an elegant problem. "How, he asked, "can a hen's egg, unsupported, be made to stand on its end?" When all had tried in vain to do this, he tapped the shell gently upon the table, cracked it, and in this way made it stand. The others laughed, and exclaimed that they could do the same thing. "No doubt you can, now that you have seen how it can be done," said he, "but how is it that no one could do it before me?"

5. I believe that the same thing would have happened if John Faust, the inventor of printing, had made it known that he possessed a method by which one man, within a week, could copy more books than ten of the fastest copyists could copy in a year in the ordinary way; that the books would be better written; that from beginning to end all the copies would be exactly similar; and that all would be absolutely free from errors provided that one copy had been corrected. Who would have believed him? Who would not have thought it a riddle, or a piece of vain and foolish boasting? And yet every child knows now that this is sober truth.

6. If Berthold Schwartz, the inventor of muskets, had addressed the archers with these words: "Your bows, your catapults, and your slings are of little worth. I will give you a weapon which, without any human force, by the agency of fire alone, will not only hurl forth stones and iron, but will propel them farther and with more certainty, so that they will strike, uproot, or lay low whatever comes in their way." Which of them would not have received him with laughter? So much is it the custom to consider everything new as marvellous and incredible.

7. Nor could the American Indians comprehend how one man is able to communicate his thoughts to another without the use of speech, without a messenger, but by simply sending a sheet of paper. Yet with us a man of the meanest intelligence can understand this.

Thus do the perplexities of one age afford amusement to the next.
8. I can easily see that this will happen to my new undertaking; in fact, I have already experienced it. Some people are certain to be indignant that there are men who find imperfections in the schools, books, and methods in use, and who dare to promise something unusual and extraordinary.

9. It would be easy for me to appeal to results as the most trustworthy witnesses (such confidence do I place in my God). But since I am writing this, not for the unlearned crowd, but for men of education, I must give demonstrative proof that it is possible to imbue all the young with knowledge, virtue, and piety, and to do so without that unpleasantness and difficulty continually experienced by the teachers, no less than by the learners, under the old system.

10. The one and sufficient demonstration is this: That each individual creature not only suffers itself to be easily led in the direction which its nature finds congenial, but is actually impelled towards the desired goal, and suffers pain if any obstacle be interposed.

11. A bird learns to fly, a fish to swim, and a beast to run without any compulsion. They do these things of their own accord as soon as they feel that their limbs are sufficiently strong. Water runs downhill of its own accord, and, in the same way, fire burns when fuel and a current of air are supplied; a round stone rolls down hill, while a square stone remains stationary; the eye and a mirror receive the impression of an object when there is sufficient light, and seeds sprout when their surroundings are suitably warm and damp. In fact, each of these things strives to fulfil the function for which it is naturally fitted, and does this more perfectly when assisted, no matter how slight the assistance may be.

12. Since then, as we saw in chap. v., the seeds of knowledge, of virtue, and of piety exist in all men (with the exception of monstrosities), it follows of necessity that they need nothing but a gentle impulse and prudent guidance.
IT IS POSSIBLE TO REFORM SCHOOLS

13. But, it is objected, it is not out of every piece of wood that a Mercury can be carved. I answer: But out of every human being, if he be not utterly corrupt, a man can be formed.

14. But our inner strength, some one will remark, has been weakened by the Fall. I reply, weakened, yes, but not extinguished. Even our bodily force, if it be in bad condition, can be restored to its natural vigour by walking, running, and artificial forms of exercise. For, although the first created were able to walk, speak, and think as soon as they came into existence, while we cannot do so unless taught by practice, it does not therefore follow that these things cannot be learned without perplexity, labour, and uncertainty. For, if we learn without very great difficulty to perform the functions of the body, such as eating, drinking, walking, and jumping, why should we not learn to perform those of the mind with similar ease, if the proper instruction be given? Again, in a few months a horse-trainer can teach a horse to trot, jump, run in a circle, and perform evolutions to signs given by a whip; a mere circus performer teaches a bear to dance, a hare to beat the drum, and a dog to plough, to wrestle, or to divine; a weak old woman can teach her parrot, her magpie, or her crow to imitate a human voice or a melody; and all these things can be taught in a short time, although they are contrary to nature. And shall not a man be easily taught those things to which nature, I will not say admits him, or leads him, but rather urges and impels him? The trainers of animals would laugh at any one who seriously brought forward this argument.

15. But it is objected that, owing to the difficulty of the subjects to be learned, all men cannot grasp them. I reply: What is that difficulty? Does there exist any body of such a dark colour that it cannot be reflected in a mirror, if placed conveniently in the light? Is there anything that cannot be painted on a canvas, provided that the man who paints has learned the art of painting? Is there any seed or root that the earth cannot receive and
bring to germination by its warmth, if the gardener under-
stand when, where, and how it should be sown? More-
over, there is in the world no rock or tower of such a
height that it cannot be scaled by any man (provided he
lack not feet) if ladders are placed in the proper position
or steps are cut in the rock, made in the right place, and
furnished with railings against the danger of falling over.
It is true that very few scale the heights of wisdom, though
many start gaily on the journey, and that those who get any
distance do so at the cost of toil, loss of breath, weariness,
and giddiness; this, however, does not prove that there
is anything inaccessible to the human intellect, but only
that the steps are not well disposed, or are insufficient,
dangerous, and in bad repair—in other words, that the
method is complicated. It is an undoubted fact that any
man can attain any height that he may desire by means
of steps that are properly disposed, sufficient in number,
solid, and safe.

16. It will be urged, Some men have such weak
intelects that it is not possible for them to acquire
knowledge. I answer, It is scarcely possible to find a
mirror so dulled that it will not reflect images of some kind,
or for a tablet to have such a rough surface that nothing
can be inscribed on it. Again, if the mirror be soiled by
dirt or by spots, it must first be cleaned; if the tablet be
rough, it must be polished; both will then perform their
functions. In the same way, if teachers take sufficient
trouble, men will become polished, and finally all men will
understand all things (I stand firmly by my watchword
because my fundamental principles prove correct). There
is naturally a difference in intellects, and while those who
are slow may only be able to attain to one stage of
knowledge, the more gifted advance higher and higher,
from one object to another, and collect new observations
which are of great utility. Finally, though there may be
some intellects that do not admit of culture, just as knotty
wood is unsuitable for carving, even then my assertion will
hold good for men of ordinary capacity, of whom, through
IT IS POSSIBLE TO REFORM SCHOOLS

God's grace, there is always a sufficiency. Indeed a man quite wanting in intellect is as rare a phenomenon as one who, from his birth, has lacked his full complement of limbs. For, in truth, blindness, deafness, lameness, and weakness seldom accompany a man from his cradle, but are caused by his own negligence; and thus it is with exceptional weakness of intellect.

17. A further objection is brought forward: With many not the capacity to learn but the inclination is lacking, and to compel these against their will is as unpleasant as it is useless. I answer: There is a story told of a philosopher who had two pupils, of whom one was idle and the other industrious. Both were sent away by their master; for one would not learn, though able to do so, while the other could not, though anxious to acquire knowledge. But how does the matter stand if it be shown that the teacher himself is the reason of the pupil's aversion to learning? Truly did Aristotle say that all men are born anxious to acquire knowledge, and that this is so we have seen in chapters v. and xi. In practice, however, the tender indulgence of parents hinders the natural tendency of children, and later on frivolous society leads them into idle ways, while the various occupations of city and court life, and the external circumstances which surround them, turn them away from their real inclinations. Thus it comes to pass that they show no desire to investigate what is unknown, and cannot concentrate their thoughts with ease. (For just as the tongue, when permeated with one flavour, judges another with difficulty, so the mind, when occupied with one subject, finds it hard to give its attention to another.) In these cases the external distraction must first be removed; nature will then assert itself with its original vigour, and the desire for knowledge will once more be apparent. But how many of those who undertake to educate the young appreciate the necessity of first teaching them how to acquire knowledge? The turner shapes a block of wood with his axe before he turns it; the blacksmith heats iron before he hammers it; the cloth-
weaver, before he spins his wool, first cleans, washes, cards, and fulls it; the shoemaker, before he sews the shoe, prepares, shapes, and smooths the leather; but who, I ask, ever thinks it necessary that the teacher, in the same way, should make his pupils anxious for information, capable of receiving instruction, and therefore ready for a many-sided education, before he begins to place knowledge before them? Teachers almost invariably take their pupils as they find them; they turn them, beat them, card them, comb them, drill them into certain forms, and expect them to become a finished and polished product; and if the result does not come up to their expectations (and I ask you how could it?) they are indignant, angry, and furious. And yet we are surprised that some men shrink and recoil from such a system. Far more is it matter for surprise that any one can endure it at all. //

18. This is a suitable place in which to make a few remarks about differences of character. Some men are sharp, others dull; some soft and yielding, others hard and unbending; some eager after knowledge, others more anxious to acquire mechanical skill. From these three pairs of contradictory characters we get in all six distinct divisions.

19. In the first division must be placed those who are sharp-witted, anxious to learn, and easily influenced. These, more than all others, are suited for instruction. There is no need to provide them with what we may term a nutritive diet of knowledge, for, like goodly trees, they grow in wisdom of themselves. Nothing is needed but foresight; for they should not be allowed to hurry on too fast and thus to tire themselves out and wither away before their time.

20. Others are sharp-witted, but inclined to be slow and lazy. These must be urged on.

21. In the third place we have those who are sharp-witted and anxious to learn, but who at the same time are perverse and refractory. These are usually a great source of difficulty in schools, and for the most part are given up in despair. If treated in the right way, however,
they frequently develope into the greatest men. A good example of this type is Themistocles, the great Athenian general. As a youth he was very wild, so that his tutor said to him: "My boy, you will not develope into anything mediocre; you will be either of great use or of great harm to your country." And later on, when people wondered at his strange character, he used to say, "Wild colts make the best horses, if only they are properly trained." Indeed, this was the case with Bucephalus, the horse of Alexander the Great. For, when Alexander saw that his father Philip was about to give away this unruly animal, which would suffer no rider on his back, he said: "What a magnificent horse these people are spoiling. They are unskilled and do not know how to treat it!" He forthwith took the horse in hand, and with marvellous skill (for he never used blows) he got it into such a condition that not only then but ever afterwards it carried him well, and no horse more noble or more worthy of his great master could be found in the whole world. Plutarch, who tells us this anecdote, remarks: "This story reminds us that many men of good parts are ruined by their teachers, who, in their inability to rule or to guide free men, treat them not as horses but as asses."

22. In the fourth place we have those who are flexible and anxious to learn, but who at the same time are slow and heavy. These can follow in the footsteps of the last-mentioned. But to render this possible the teacher must meet their weak natures half-way, must lay no heavy burden on them, must not demand anything excessive, but rather have patience, help them, strengthen them, and set them right, that they may not be disheartened. Though such pupils take longer to come to maturity, they will probably last all the better, like fruit that ripens late. And, just as the impression of a seal made in lead lasts a long time, though hard to make, so these men have more stable characters than those who are more gifted, and do not easily forget what they have once learned. At school, therefore, they should be given every opportunity.
23. The fifth type are those who are weak-minded and at the same time lazy and idle. With these also a great improvement can be made, provided they are not obstinate. But great skill and patience are necessary.

24. Finally, we have those whose intellects are weak and whose dispositions are perverse and wicked as well. These seldom come to any good. But, as it is certain that nature always provides some antidote for pernicious things, and that barren trees can be rendered fruitful if properly transplanted, we ought not to give up all hope, but should see if the perverseness, at least, cannot be combated and got rid of. It is only when this proves impossible that the twisted and knotted piece of wood may be cast aside, since it is useless to attempt to carve a Mercury out of it. "Barren land," says Cato, "should not be cultivated; nor even once ploughed." But an intellect of this kind, amenable to no treatment, can scarcely be found in a thousand, and this is a great proof of God's goodness.

25. The substance of these remarks is in harmony with the following saying of Plutarch: "For the characters of young children, no man is responsible; but it is in our power to make them virtuous by a proper training." Mark this well; he says "in our power." For the gardener can unfailingly train a struggling shoot into a tree, by using his skill in transplanting.

26. The four following reasons show that all the young, though of such different dispositions, may be instructed and educated by the same method.

27. Firstly: For all men the goal is the same, namely, knowledge, virtue, and piety.

28. Secondly: All men, though their dispositions may differ, possess the same human nature, and are endowed with the same organs of sense and of reason.

29. Thirdly: The differences of character are caused by nothing more than a superfluity or a lack of some of the elements in the natural harmony, just as bodily diseases are nothing but abnormal states of wetness or dryness, of heat or cold. For example, what is sharpness
of intellect but the fineness and rapid motion of the vital spirit in the brain, which passes through the sensory lobes with very great speed, and rapidly apprehends external objects? But if no obstacle be put in the way of this rapid motion, it dissipates the intellect and leaves the brain either weak or sluggish. Hence it is that so many precocious boys either die young or become stupid.

On the other hand, what is stupidity but a clammy viscosity of the humours of the brain, which can only be set in motion by constant suggestion? What are insolence and intractability but an excess of spirit and stubbornness, which must be tempered by discipline? What is slackness but a great lack of spirit which must be made good? Just as, then, the best remedies for bodily diseases are not those which try to put one extreme to flight by another (for this only makes the struggle greater), but those which seek to moderate all extremes, so that there shall not be too little on one side and too much on the other; so the best remedy against the errors of the human mind is a didactic method of such a kind that by its means excess and defect may be neutralised in the natural disposition, and that all the mental principles may be brought into harmony and into a pleasant agreement. Our method, therefore, is intended for intellects in which no element exists in an extreme form (and indeed these are always the most common), so that neither reins may be wanting to restrain active minds (that they may not wear themselves out before their time) nor spurs and goads to urge on the laggards.

30. Finally: Every excess or defect of disposition can be counteracted as long as it is not of old standing. In warfare, recruits are mixed with old soldiers; the weak and the strong, the sluggish and the active, fight under the same standard and obey the same orders as long as the battle continues. But, when the victory is gained, each pursues the enemy as far as he is able, and takes as much booty as he wants. Thus it is in the camp of knowledge; the slow are mixed with the swift, the weak with the quick-witted,
the obstinate with the yielding, and are guided by the same precepts and examples as long as guidance is necessary. But, when school-days are over, each one must finish the remainder of his studies with what speed he can.

31. When I talk of admixture of intellects, I refer not so much to the spot where the instruction takes place as to the additional assistance that can be given to the pupil. For instance, if the teacher observe that one boy is cleverer than the rest, he can give him two or three stupid boys to teach; if he perceive one more trustworthy than the others, he may allow him to watch and to control those who have less character. Both will gain great advantage from this, provided that the teacher keep his eye on them, to see that everything is conducted as reason prescribes. But it is now time to have done with preliminaries, and to deal with the real subject of this treatise.
CHAPTER XIII

THE BASIS OF SCHOOL REFORM MUST BE EXACT ORDER IN ALL THINGS

1. We find on investigation that the principle which really holds together the fabric of this world of ours, down to its smallest detail, is none other than order; that is to say, the proper division of what comes before and what comes after, of the superior and the subordinate, of the large and the small, of the similar and dissimilar, according to place, time, number, size, and weight, so that each may fulfil its function well. Order, therefore, has been called the soul of affairs. For everything that is well ordered preserves its position and its strength as long as it maintains its order; it is when it ceases to do so that it grows weak, totters, and falls. This may be seen clearly in instances taken from nature and from art.

2. Through what agency, I ask, does the world maintain its present condition? what is it that gives it its great stability? It is this, that each creature, obeying the command of nature, restrains its action within the proper limits; and thus, by careful observation of order in small details, the order of the universe is maintained.

3. Through what agency is the flux of time divided so accurately and so continuously into years, months, and days? Through none but the inflexible order of the vault of heaven.

4. What enables bees, ants, and spiders to do work of such fineness that the mind of man finds it easier to marvel
at than to imitate it? Nothing but their natural talent for harmoniously combining order, number, and mass in their constructions.

5. What is it that constitutes the human body such a marvellous instrument that it can perform almost countless functions, even though it have very few resources at its disposal? I mean, that with the few limbs it possesses, it can produce works whose complexity is so wondrous that nothing remains to be desired? It is without question the harmonious disposition of the limbs, and of their constituent parts, that brings this about.

6. What is it that makes it possible for a single mind to rule the whole body in which it dwells, and to direct so many operations at the same time? Nothing but the harmonious order in which the limbs are connected, and which enables them to obey the slightest hint given by the mind, and to set themselves in motion immediately.

7. How is it that a single man, a king or an emperor, can rule whole nations; that, although there are as many wills as there are individuals, all subordinate themselves to the service of that one man, and that, if his affairs go well, the affairs of each subject also must prosper? Again it is order that brings this about. Through its agency all are held together by the connecting bands of law and of obedience, so that some subjects are directly subordinate to and in immediate contact with the supreme ruler, while others in their turn are subordinate to these, and so on down to the meanest serf. The arrangement thus resembles a chain in which each link is intimately connected so that if the first be moved or remain at rest all the others will follow suit.

8. How was it that Hiero, unaided, could move a weight which hundreds of men had in vain tried to stir? Assuredly it was by means of a cleverly-devised machine, in which the cylinders, wheels, and other parts were arranged in such a way that when one worked on the other the force applied was much increased.

9. The terrible operations of artillery, by which walls
are broken down, towers are shattered, and armies are laid low, depend on nothing but the proper arrangement of materials, so that the active is placed in close connection with the passive element; that is to say, on the proper mixing of saltpetre with sulphur (the coldest substance with the hottest), on the proper construction of the cannon, on its being skillfully loaded with powder and missiles, and, lastly, on its being correctly pointed at the objects to be hit. If one of these conditions be not properly fulfilled, the whole apparatus is useless.

10. How is it that the processes of printing, by which books can be multiplied quickly, neatly, and correctly, are properly carried out? Assuredly by means of order. The type must be cut, moulded, and polished, placed suitably in the type-boxes, and then arranged in the right order, while the paper must be prepared, damped, stretched, and placed under the press.

11. To take another example of mechanism. How is it that a carriage, a construction of wood and iron, can be so easily drawn by the horses that are fastened to it, and can be of such use for the conveyance of men and burdens? This is brought about by nothing but the skilful arrangement of wood and of iron in the wheels, the axle-trees, and the shafts. If one of these parts give way, the whole construction is useless.

12. How is it that men can trust themselves to the stormy sea in a construction made of a few pieces of wood? How is it that they make their way to the antipodes and return safe and sound? It is nothing but the proper combination of keel, mast, rudder, compass, etc., in the ship that enables them to do so. If any one of these fail in its action, they are in great danger of shipwreck or of foundering.

13. Finally, how is it that the machine for measuring time, the clock, which is nothing but a well-arranged and well-devised disposition of iron parts, moves harmoniously and evenly, and marks off minutes, hours, days, months, and sometimes years? and this not only for the eyes but
for the ears as well, that it may give some sign at night and to those at a distance? How is it that such an instrument can wake a man out of sleep at a given hour, and can strike a light to enable him to see? How is it that it can indicate the quarters of the moon, the positions of the planets, and the eclipses? Is it not a truly marvellous thing that a machine, a soulless thing, can move in such a life-like, continuous, and regular manner? Before clocks were invented would not the existence of such things have seemed as impossible as that trees could walk or stones speak? Yet every one can see that they exist now.

14. What is the hidden power that brings this to pass? Nothing but the all-ruling force of order; that is to say, the force derived from arranging all the parts concerned according to their number, size, and importance, and in such a manner that each one shall perform its own proper function as well as work harmoniously with and assist the other parts whose action is necessary to produce the desired result; that is to say, the size of each part must be carefully regulated to suit that of the rest; each part must fit properly into those which surround it; and the general laws that regulate the equal distribution of force to the several parts must be observed. In such a case all the processes are more exact than in a living body controlled by one mind. But if any part get out of position, crack, break, become loose or bent, though it be the smallest wheel, the most insignificant axle, or the tiniest screw, the whole machine stops still or at least goes wrong, and thus shows us plainly that everything depends on the harmonious working of the parts.

15. The art of teaching, therefore, demands nothing more than the skilful arrangement of time, of the subjects taught, and of the method. As soon as we have succeeded in finding the proper method it will be no harder to teach school-boys, in any number desired, than with the help of the printing-press to cover a thousand sheets daily with the neatest writing, or with Archimedes' machine to move houses, towers, and immense weights, or to cross the
ocean in a ship, and journey to the New World. The whole process, too, will be as free from friction as is the movement of a clock whose motive power is supplied by the weights. It will be as pleasant to see education carried out on my plan as to look at an automatic machine of this kind, and the process will be as free from failure as are these mechanical contrivances, when skilfully made.

16. Let us therefore endeavour, in the name of the Almighty, to organise schools in such a way that in these points they may bear the greatest resemblance to a clock which is put together with the greatest skill, and is cunningly chased with the most delicate tools.
CHAPTER XIV

THE EXACT ORDER OF INSTRUCTION MUST BE BORROWED FROM NATURE, AND MUST BE OF SUCH A KIND THAT NO OBSTACLE CAN HINDER IT.

1. Let us then commence to seek out, in God's name, the principles on which, as on an immovable rock, the method of teaching and of learning can be grounded. If we wish to find a remedy for the defects of nature, it is in nature herself that we must look for it, since it is certain that art can do nothing unless it imitate nature.

2. A few examples will make this clear. We see a fish swimming in the water; it is its natural mode of progression. If a man wish to imitate it, it is necessary for him to use in a similar manner the limbs that are at his disposal; instead of fins he must employ his arms, and instead of a tail, his feet, moving them as a fish moves its fins. Even ships are constructed on this plan; in the place of fins they must employ oars or sails, and in the place of a tail, the rudder. We see a bird flying through the air; it is its natural mode of progression. When Daedalus wished to imitate it, he had to take wings (large enough to carry such a heavy body) and set them in motion.

3. The organ of sound production in animals is a pipe consisting of muscular rings, provided at the top with the thyroid cartilage, as with a lid, and at the bottom with the lungs, as with a wind-bag.
On this model flutes, whistles, and other wind instruments are made.

4. It has been discovered that the substance that causes thunder in the clouds, and hurls down fire and stones, is saltpetre ignited in combination with sulphur. In imitation of this, gunpowder is now made out of sulphur and saltpetre. When this is ignited and fired from cannon, a mimic storm, with thunder and lightning, is produced.

5. It has been found that water always tends to preserve a level surface, even in vessels that communicate but are at some distance from one another. The experiment has been made of conducting water through pipes, and it has been found that it will rise from any depth to any height, provided that it originally fall from that height. This is an artificial arrangement, but it is also natural; for the exact mode in which the action takes place is artificial, but the law on which the action depends is natural.

6. The vault of heaven, on observation, has been found to revolve continuously, thus, by the various revolutions of the planets, producing the changes of the seasons which are so pleasant. In imitation of this an instrument has been devised, representing the daily revolution of the vault of heaven. It is composed of wheels arranged so that not only can one be driven by the other, but that all can be put into continuous motion. Now it was necessary to construct this instrument out of movable and immovable parts, as the universe itself is constructed, and consequently we find a solid pedestal, pillars, and circular rings, corresponding to the earth, the immovable element in the universe, while in place of the movable orbits in the heaven we have the various wheels. But because it was impossible to command any one wheel to turn round and to carry others with them (as the Creator gave the heavenly lights the power to move themselves, and others with them), the motive power has to be borrowed from nature, and a weight or a spring is used.
Either a weight is hung from the axle of the principal wheel, and by its tension causes the axle, the wheel to which it belongs, and the other wheels to turn; or a long strip of steel is forcibly bound round the axle, and by its endeavours to get free and straighten itself, makes the axle and the wheel turn round. In order that the rotation may not be too fast, but slow like that of the vault of heaven, other wheels are added, of which the last, driven by two teeth only, makes a clicking noise and is analogous to the change between the coming and the going light, or to that between day and night. In addition to that part of the mechanism which gives the signal for the hours and the quarters, skilfully-devised triggers are added, which set it in motion at the right time, and then stop it again, just as nature, by the movement of the vault of heaven, allows winter, spring, summer, and autumn to come and to depart again at the right moment.

7. It is now quite clear that that order, which is the dominating principle in the art of teaching all things to all men, should be, and can be, borrowed from no other source but the operations of nature. As soon as this principle is thoroughly secured, the processes of art will proceed as easily and as spontaneously as those of nature. Very aptly does Cicero say: "If we take nature as our guide, she will never lead us astray," and also: "Under the guidance of nature it is impossible to go astray." This is our belief, and our advice is to watch the operations of nature carefully and to imitate them.

8. But some one may laugh at our expectations and may cast in our teeth the saying of Hippocrates: "Life is short, and art is long; opportunities are fleeting, experience is deceptive, and judgment is difficult." Here are five obstacles, the reasons why so few scale the heights of wisdom:—

(i.) The shortness of life; through which so many are snatched away in youth before their preparations for life are finished. (ii.) The perplexing crowd of objects which
the mind has to grasp, and which makes the endeavour to include all things within the limits of our knowledge, very weary work. (iii.) The lack of opportunities to acquire the arts, or their rapid departure when they occur (for the years of youth, which are the most suitable for mental culture, are spent in playing, and the succeeding years, in the present condition of mankind, bring far more opportunities for worthless than for serious matters); or if a suitable opportunity present itself, it vanishes before we can grasp it. (iv.) The weakness of our intellects and the lack of sound judgment. The result of this is that we get no farther than the outside shell, and never attain to the kernel. (v.) Finally, the circumstance that, if any wish to grasp the true nature of things by patient observation and experiments repeated as often as possible, the process is too wearisome, and is at the same time deceptive and uncertain (for instance, in such accurate observations the most careful observer may make an error, and as soon as one error creeps in, the whole observation becomes worthless).

9. If all this be true, how can we dare hope for a universal, sure, easy, and thorough road to learning? I answer: Experience teaches us that this is true, but the same experience teaches us also that the proper remedies can be found. These things have been ordained thus by God, the all-wise arranger of the universe, and are for our good. He has given us a short span of life because, in our present state of corruption, we should be unable to employ a longer one profitably. For if we, who are born and die, and with whom the end of life is but a few years distant from the beginning, give ourselves up to folly: what would we not do if we had hundreds or thousands of years before us? God, therefore, has only wished to grant as much time as He deemed sufficient preparation for a better life. For this purpose life is long enough, if only we know how to use it.

10. The diversity of objects has been equally ordained by God for our advantage, that there might be no
lack of material to occupy, exercise, and educate our minds.

11. God permits opportunities to be fleeting, and only to be grasped by the fore-lock, that we may learn to seize them the very instant they present themselves.

12. Experience is deceptive in order that our attention may be excited, and that we may feel the necessity of penetrating to the essential nature of things.

13. Finally, judgment is difficult, in order that we may be urged on to eagerness and to continual effort, and that the hidden wisdom of God, which permeates all things, may, to our great satisfaction, become ever more apparent.

"If everything could be easily understood," says St. Augustine, "men would neither seek wisdom with keenness, nor find it with exultation."

14. We must therefore see in what way those obstacles which God's foresight has placed in our paths to make us keener and more energetic may, with God's aid, be set aside. This can only be attained—

(i.) By lengthening our lives, that they may be sufficiently long for the scheme proposed.

(ii.) By curtailing the subjects taught, that they may be proportionate to the duration of life.

(iii.) By seizing opportunities, and not letting them slip away unused.

(iv.) By unlocking the intellect, that it may grasp things with ease.

(v.) By laying a foundation that is not to be shaken, and that will not deceive us, in the place of a tottering fabric of superficial observation.

15. We will therefore proceed, taking nature as our guide, to seek out the principles:—

(i.) Of prolonging life.

(ii.) Of curtailing the subjects, that knowledge may be acquired faster.

(iii.) Of seizing opportunities, that knowledge may be acquired without fail.
(iv.) Of unlocking the intellect, that knowledge may be easily acquired.

(v.) Of sharpening the judgment, that knowledge may be thoroughly acquired.

To each of these points we shall devote a chapter. The question of curtailing the subjects of instruction will be treated of last.
CHAPTER XV

THE BASIS OF THE PROLONGATION OF LIFE

1. Aristotle, as well as Hippocrates, has complained of the shortness of human life, and accuses nature of granting a long term of years to stags, ravens, and other animals, while she hems in by narrow boundaries the lives of men born to great responsibility. Seneca, however, opposes this view, and wisely says: "The life that we receive is not short, unless we make it so. We suffer from no lack of years, but carouse away those that are granted us. Life is long, if we do but know how to use it." And again: "Our lives are sufficiently long, and, if we order them well, allow us to bring the greatest undertakings to completion" (De Brevitate Vita, cc. i. and ii.).

2. If this be correct, and indeed it is very true, it is grossly culpable on our parts if our lives do not prove sufficiently long to bring great undertakings to completion, since the reason is that we waste our lives, partly by taking no care of them, so that they do not reach the natural limit, and partly by fritteriing them away on worthless objects.

3. A trustworthy authority (Hippolytus Guarino) asserts, and gives good reasons for his assertion, that a man of the most delicate constitution, if he come into the world without any deformity, possesses enough vitality to carry him on to his sixtieth year; while a very strong man should attain to his hundredth year. If any die before this age (it is, of course, well known that most men die as
children, as youths, or in middle age), they are themselves to blame, since, by excesses, or by neglect of the natural demands of life, they have undermined their own health and that of their children, and have hastened their death.

4. The examples of men who, before middle age, have reached a point to which others could not attain in the course of a long life, prove that a short lifetime (i.e. one of fifty, forty, or thirty years) is sufficient to realise the highest aims, if only it be properly used. Alexander the Great died when he was thirty-three years old, and he was not only a master of all the sciences, but also conqueror of the world, which he had subdued less by sheer force than by the wisdom of his plans, and the rapidity with which he put them into execution. Giovanni Pico Mirandola, who was even younger than Alexander when he died, attained by his philosophical studies such proficiency in all the departments of human knowledge, that he was considered the marvel of his age.

5. To take one more example, Jesus Christ, our Lord, remained only thirty-four years on earth, and in that time completed the task of Redemption. This He undoubtedly did to prove (for with Him every event has a mystic meaning) that whatever length of life a man may enjoy, it is sufficient to serve him as a preparation for eternity.

6. I cannot leave this question without quoting a golden saying of Seneca (out of his ninety-fourth letter): "I have," he says, "found many men who are just in their dealings with men, but few who are just in their dealings with God. We daily lament our fate; but what does it matter how soon we quit this world, since we must certainly quit it one day or other? Life is long if it be full, and it becomes full if the spirit exert its power on itself; if it learn the secret of self-control." And again: "I entreat of you, my Lucilius! let us strive that our lives, like earthly jewels, may be, not of great bulk, but of great weight"; and a little farther on: "Let us, therefore, deem that man one of the blest, who has used well the time allotted to him, no matter how short it may have been. For he has seen the true light.
He has not been one of the common herd; but has lived a full life, and has come to maturity.” And again: “As a perfect man can exist in a small body, so can a perfect life be found in a short term of years. The duration of life is a purely accidental circumstance. Do you ask which is the path of life that reaches farthest? It is the path that leads to wisdom. He who attains wisdom, has reached not only the farthest, but also the highest goal.”

7. Against this shortness of life, which is complained of, there are two remedies for us and for our children (and therefore for schools also). We must take all possible precautions that—

(i.) Our bodies may be protected from disease and from death.

(ii.) Our minds may be placed in such an environment that they can attain all knowledge.

8. The body must be protected from disease and from accidents, firstly, because it is the dwelling-place of the soul, which must leave this world as soon as ever the body is destroyed. If it fall into bad repair, and suffer damage in any of its parts, the soul, its guest, will have an inhospitable abode. Therefore, if we wish to dwell as long as possible in the palace of this world, into which we have been brought by God’s grace, we must take wise forethought for the fabric of our bodies.

Secondly, this same body is not only intended to be the dwelling-place of the reasoning soul, but also to be its instrument, without which it could hear nothing, see nothing, say nothing, conduct no business, and could not even think. And since nothing exists in the mind that has not previously existed in the senses, the intellect takes the material of all its thoughts from the senses, and performs the operations of thought in a manner that may be termed “inner sensation,” that is to say, by acting on the images of things that are brought before it. It follows, therefore, that, if the brain receive an injury, the imagination will be impaired, and that if an impression be made on the body, an impression will be made on the soul.
also. We may therefore unhesitatingly say that all should pray that they may have a sound mind in a sound body.

9. Our bodies are preserved in health and strength by a regular and moderate life, and on this we will make a few remarks from the medical point of view, taking a tree as illustration. In order to maintain its freshness, a tree needs three things: (1) a continuous supply of moisture; (2) copious transpiration; (3) an alternating period of rest and activity.

Moisture is necessary, because the tree would wither and dry up without it, but it must not be supplied in too great a quantity, as, if it be, it causes the roots to rot away. In the same way the body needs nourishment, because it wastes away from hunger and thirst without it; but it should not obtain a supply so large that the stomach is unable to digest it. The greater the moderation with which men partake of food, the easier they find its digestion. The generality of men pay but little attention to this law, and by taking too much food diminish their strength and shorten their lives. For death is caused by disease, disease by unwholesome juices, and these, in turn, by insufficient digestion. Insufficient digestion arises from over-nutrition, and takes place when the stomach is so full that it cannot digest, and is compelled to supply the various members of the body with semi-digested juices, and in this case it is impossible that diseases should not arise. As the son of Sirach says: "By surfeiting have many perished, but he that taketh heed prolongeth his life" (Ecclesiasticus xxxvii. 31).

10. In order that good health may be preserved, it is necessary that nourishment be not only moderate in quantity, but also simple in quality. When a tree is young and tender, the gardener does not water it with wine or with milk, but with the liquid that suits trees, namely water. Parents should therefore take care not to spoil their boys, particularly those who study, or ought to study, by giving them dainties. Are we not told that Daniel and his companions, the youths of noble birth who had to
apply themselves to the pursuit of wisdom, lived on a diet of pulse and water, and that they were found to be more capable and more active, and, what is of greater value, more intelligent, than all the other youths who ate of the king's meat? (Daniel i. 12 sqq.). But of these particulars we will speak in another place.

11. A tree must also transpire, and needs to be copiously refreshed by wind, rain, and frost; otherwise it easily falls into bad condition, and becomes barren. In the same way the human body needs movement, excitement, and exercise, and in daily life these must be supplied, either artificially or naturally.

12. Finally, a tree needs rest at stated periods, that it may not have to put forth branches, blossoms, and fruit perpetually, but may have some time to fulfil its inner functions, to develop sap, and in this way to strengthen itself. It was for this reason that God ordained that winter should follow summer, namely to guarantee rest to all things that live on the earth, and even to the earth itself, since He commanded that the fields should lie fallow every seventh year (Lev. xxv.). In the same way He has ordained the night for man, and for other animals, in order that, by sleep and by resting their limbs, they may once more gather together the strength which the exertions of the day have dissipated. Even the smaller periods, such as the hours, are devised with a view to giving the body and the mind some relaxation; otherwise a strained and unnatural condition would set in. It is, therefore, useful to intersperse the labours of the day with recreation, amusements, games, merriment, music, and such-like diversions, and thus to refresh the inner and the outer senses.

13. He who observes these three principles (that is to say, eats moderately, exercises his body, and uses the relaxations supplied by nature) cannot fail to preserve his life and his health as long as possible. We naturally leave out of consideration accidents that depend on a dispensation higher than ours.
We see then that a large portion of the good organisation of schools consists of the proper division of work and of rest, and depends on the disposition of studies, intervals to relieve the strain, and recreation.

14. This can be attained by the skilful disposition of the time devoted to study. Thirty years seem insignificant, and are easily dismissed from the tongue. But these years include many months, more days, and countless hours. In a single period of such duration much progress can be made, no matter how slow the process of advancement may be, provided it be continuous. We can see this in the growth of plants. It is impossible for the sharpest sight to perceive the process, since it takes place too gradually; but every month some increase is visible, and at the end of thirty years every one can see that the sapling has turned into a large and shady tree. The same holds good in the growth of our bodies. We do not see them growing, but only perceive that they have grown. So, too, with the acquisition of knowledge by the mind, as we learn from the well-known Latin couplet:

To a little add a little, and to that little yet a little more,
And in a short time you will pile up a large heap.

15. He who realises the natural strength of progress will easily understand this. From each bud a tree puts forth but one shoot yearly; but in thirty years the same tree will possess thousands of shoots, large and small, and leaves, blossoms, and fruit without number. Why then should it seem impossible to bring the activity of a man to any degree of intensity or fulness, and this in twenty or thirty years? Let us examine the matter more closely.

16. There are twenty-four hours in a day, and if, for the daily uses of life, we divide these into three parts, setting aside eight hours for sleep, and the same number for the external needs of the body (such as care of the health, meals, dressing and undressing, agreeable recreation, friendly converse, etc.), we have eight hours left for the serious work of life. We shall therefore have forty-
eight working hours a week (setting aside the seventh day for rest). In one year this will amount to 2945 hours, and in ten, twenty, or thirty years to an immense number.

17. If, in each hour, a man could learn a single fragment of some branch of knowledge, a single rule of some mechanical art, a single pleasing story or proverb (the acquisition of which would require no effort), what a vast stock of learning he might lay by?

18. Seneca is therefore right when he says: “Life is long, if we know how to use it; it suffices for the completion of the greatest undertakings, if it be properly employed.” It is consequently of importance that we understand the art of making the very best use of our lives, and to this point we will now direct our investigation.
CHAPTER XVI

THE UNIVERSAL REQUIREMENTS OF TEACHING AND OF LEARNING; THAT IS TO SAY, A METHOD OF TEACHING AND OF LEARNING WITH SUCH CERTAINTY THAT THE DESIRED RESULT MUST OF NECESSITY FOLLOW.

1. Exceptionally fine is that comparison made by our Lord Jesus Christ in the gospel, "So is the kingdom of God, as if a man should cast seed upon the earth; and should sleep and rise night and day, and the seed should spring up and grow, he knoweth not how. The earth beareth fruit of herself; first the blade, then the ear, then the full corn in the ear. But when the fruit is ripe, straightway he putteth forth the sickle, because the harvest is come" (Mark iv. 26).

2. The Saviour here shows that it is God who operates in everything, and that nothing remains for man but to receive the seeds of instruction with a devout heart; the processes of growth and of ripening will then continue of themselves, unperceived by him. The duty of the teachers of the young, therefore, is none other than to skilfully scatter the seeds of instruction in their minds, and to carefully water God's plants. Increase and growth will come from above.

3. Is there any who denies that sowing and planting need skill and experience? If an unpractised gardener plant an orchard with young trees, the greater number of them die, and the few that prosper do so rather through chance than through skill. But the trained gardener goes
to work carefully, since he is well instructed, where, when, and how to act and what to leave alone, that he may meet with no failure. It is true that even an experienced man meets with failure occasionally (indeed it is scarcely possible for a man to take such careful forethought that no error can arise); but we are now discussing, not the abstract question of circumspection and chance, but the art of doing away with chance by means of circumspection.

4. Hitherto the method of instruction has been so uncertain that scarcely any one would dare to say: "In so many years I will bring this youth to such and such a point; I will educate him in such and such a way." We must therefore see if it be possible to place the art of intellectual discipline on such a firm basis that sure and certain progress may be made.

5. Since this basis can be properly laid only by assimilating the processes of art as much as possible to those of nature (as we have seen in the 15th chapter), we will follow the method of nature, taking as our example a bird hatching out its young; and, if we see with what good results gardeners, painters, and builders follow in the track of nature, we shall have to recognise that the educator of the young should follow in the same path.

6. If any think this course of action petty or commonplace, let him consider that from that which is of daily occurrence and universal notoriety and which takes place with good results in nature and in the arts (the teaching art excepted), we are seeking to deduce that which is less known and which is necessary for our present purpose. Indeed, if the facts from which we derive the principles that form the basis for our precepts are known, we can entertain hopes that our conclusions will be the more evident.

First Principle

For example: a bird that wishes to multiply its species, does not set about it in winter, when everything is stiff
with cold, nor in summer, when everything is parched and withered by the heat; nor yet in autumn, when the vital force of all creatures declines with the sun's declining rays, and a new winter with hostile mien is approaching; but in spring, when the sun brings back life and strength to all. Again, the process consists of several steps. While it is yet cold the bird conceives the eggs and warms them inside its body, where they are protected from the cold; when the air grows warmer it lays them in its nest, but does not hatch them out until the warm season comes, that the tender chicks may grow accustomed to light and warmth by degrees.

8. *Imitation.*—In the same way the gardener takes care to do nothing out of season. He does not, therefore, plant in the winter (because the sap is then in the roots, preparing to mount and nourish the plant later on); nor in summer (when the sap is already dispersed through the branches); nor in autumn (when the sap is retiring to the roots once more); but in spring, when the moisture is beginning to rise from the roots and the upper part of the plant begins to shoot. Later on, too, it is of great importance to the little tree that the right time be chosen for the various operations that are needful, such as manuring, pruning, and cutting. Even the tree itself has its proper time for putting forth shoots and blossoms, for growing, and for coming to maturity.

In the same manner the careful builder must choose the right time for cutting timber, burning bricks, laying foundations, building, and plastering walls, etc.

9. *Deviation.*—In direct opposition to this principle, a twofold error is committed in schools.

(i.) The right time for mental exercise is not chosen.

(ii.) The exercises are not properly divided, so that all advance may be made through the several stages needful, without any omission. As long as the boy is still a child he cannot be taught, because the roots of his understanding are still too deep below the surface. As soon as he becomes old, it is too late to teach him, because the intellect
and the memory are then failing. In middle age it is difficult, because the forces of the intellect are dissipated over a variety of objects and are not easily concentrated. The season of youth, therefore, must be chosen. Then life and mind are fresh and gathering strength; then everything is vigorous and strikes root deeply.

10. Rectification.—We conclude, therefore, that

(i.) The education of men should be commenced in the springtime of life, that is to say, in boyhood (for boyhood is the equivalent of spring, youth of summer, manhood of autumn, and old age of winter).

(ii.) The morning hours are the most suitable for study (for here again the morning is the equivalent of spring, midday of summer, the evening of autumn, and the night of winter).

(iii.) All the subjects that are to be learned should be arranged so as to suit the age of the students, that nothing which is beyond their comprehension be given them to learn.

Second Principle

11. Nature prepares the material, before she begins to give it form.

For example: the bird that wishes to produce a creature similar to itself first conceives the embryo from a drop of its blood; it then prepares the nest in which it is to lay the eggs, but does not begin to hatch them until the chick is formed and moves within the shell.

12. Imitation.—In the same way the prudent builder, before he begins to erect a building, collects a quantity of wood, lime, stones, iron, and the other things needful, in order that he may not have to stop the work later on from lack of materials, nor find that its solidity has been impaired. In the same way, the painter who wishes to produce a picture, prepares the canvas, stretches it on a frame, lays the ground on it, mixes his colours, places his brushes so that they may be ready to hand, and then at last commences to paint.
In the same way the gardener, before he commences operations, tries to have the garden, the stocks, the grafts, and the tools in readiness, that he may not have to fetch the necessary appliances while at work, and so spoil the whole operation.

13. Deviation. — Against this principle schools are offenders: firstly, because they take no care to prepare beforehand the mechanical aids such as books, maps, pictures, diagrams, etc., and to have them in readiness for general use, but at the moment that they need this or that, they make experiments, draw, dictate, copy, etc., and when this is done by an unskilled or careless teacher (and their number increases daily), the result is deplorable. It is just as if a physician, whenever he wishes to administer a medicine, had to wander through gardens and forests, and collect and distil herbs and roots, though medicaments to suit every case should be ready to his hand.

14. Secondly, because even in school-books the natural order, that the matter come first and the form follow, is not observed. Everywhere the exact opposite is to be found. The classification of objects is unnaturally made to precede a knowledge of the objects themselves, although it is impossible to classify, before the matter to be classified is there. I will demonstrate this by four examples.

15. (1) Languages are learned in schools before the sciences, since the intellect is detained for some years over the study of languages, and only then allowed to proceed to the sciences, mathematics, physics, etc. And yet things are essential, words only accidental; things are the body, words but the garment; things are the kernel, words the shells and husks. Both should therefore be presented to the intellect at the same time, but particularly the things, since they are as much objects of the understanding as are languages.

16. (2) Even in the study of languages the proper order is reversed, since the students commence, not with some author or with a skilfully-compiled phrase-book, but with the grammar; though the authors (and in their own way
the phrase-books) present the material of speech, namely words, while the grammars, on the other hand, only give the form, that is to say, the laws of the formation, order, and combination of words.

17. (3) In the encyclopædic compilations or human knowledge, the arts are always placed first, while the sciences follow after; though the latter teach of the things themselves, the former how to manipulate the things.

18. (4) Finally: it is the abstract rules that are first taught and then illustrated by dragging in a few examples; though it is plain that a light should precede him whom it lights.

19. Rectification.—It follows, therefore, that in order to effect a thorough improvement in schools it is necessary:
(i.) That books and the materials necessary for teaching be held in readiness.
(ii.) That the understanding be first instructed in things, and then taught to express them in language.
(iii.) That no language be learned from a grammar, but from suitable authors.
(iv.) That the knowledge of things precede the knowledge of their combinations.
(v). And that examples come before rules.

THIRD PRINCIPLE

20. Nature chooses a fit subject to act upon, or first submits one to a suitable treatment in order to make it fit.

For example: a bird does not place any object in the nest in which it sits, but an object of such a kind that a chicken can be hatched from it, that is to say, an egg. If a small stone or anything else falls into the nest, it throws it out as useless. But when the process of hatching takes place, it warms the matter contained in the egg, and looks after it until the chicken makes its way out.

21. Imitation.—In the same way the builder cuts down timber, of as good quality as possible, dries it, squares it,
and saws it into planks. Then he chooses a spot to build on, clears it, lays a new foundation, or repairs the old one so that he can make use of it.

22. In the same way, if the canvas or the surface do not suit his colours, the painter tries to make them more suitable, and, by rubbing them and polishing them, fits them for his use.

23. The gardener too (1) chooses from a fruit-bearing stock a shoot that possesses as much vitality as possible; (2) transplants it to a garden, and places it carefully in the earth; (3) does not burden it with a new graft unless he sees that it has taken root; (4) before he inserts the new graft, removes the former shoot, and even cuts a piece away round the stock in order that none of the sap may perform any function other than that of vivifying the graft.

24. Deviation.—Against this principle the schools are offenders: not because they include the weak of intellect (for in our opinion all the young should be admitted into the schools) but far more because:

(1) These tender plants are not transplanted into the garden, that is to say, are not entirely entrusted to the schools, so that none, who are to be trained as men, shall be allowed to leave the workshop before their training is complete.

(2) The attempt is generally made to engraft that noblest graft of knowledge, virtue and piety, too early, before the stock itself has taken root; that is to say, before the desire to learn has been excited in those who have no natural bent in that direction.

(3) The side-shoots or root-suckers are not removed before the grafting takes place; that is to say, the minds are not freed from all idle tendencies by being habituated to discipline and order.

25. Rectification.—It is therefore desirable:

(i.) That all who enter schools persevere in their studies.

(ii.) That, before any special study is introduced, the minds of the students be prepared and made receptive of it. (See the following chapter, Principle 2.)
(iii.) That all obstacles be removed out of the way of schools.

"For it is of no use to give precepts," says Seneca, "unless the obstacles that stand in the way be removed." But of this we will treat in the following chapter.

**Fourth Principle**

26. *Nature is not confused in its operations, but in its forward progress advances distinctly from one point to another.*

For example: if a bird is being produced, its bones, veins, and nerves are formed at separate and distinct periods; at one time its flesh becomes firm, at another it receives its covering of skin or feathers, and at another it learns how to fly, etc.

27. *Imitation.*—When a builder lays foundations he does not build the walls at the same time, much less does he put on the roof, but does each of these things at the proper time and in the proper place.

28. In the same way a painter does not work at twenty or thirty pictures at once, but occupies himself with one only. For, though he may from time to time put a few touches to some others or give his attention to something else, it is on one picture and one only that he concentrates his energies.

29. In the same way the gardener does not plant several shoots at once, but plants them one after the other, that he may neither confuse himself nor spoil the operation of nature.

30. *Deviation.*—Confusion has arisen in the schools through the endeavour to teach the scholars many things at one time. As, for example, Latin and Greek grammar, perhaps rhetoric and poetic as well, and a multitude of other subjects. For it is notorious that in the classical schools the subject-matter for reading and for composition is changed almost every hour throughout the day. If this be not confusion I should like to know what is. It is
just as if a shoemaker wished to make six or seven new shoes at once, and took them up one by one in turn, only to lay them aside in a few minutes; or as if a baker, who wished to place various kinds of bread in his oven, were to take them out again immediately, removing one kind as he put in another. Who would commit such an act of folly? The shoemaker finishes one shoe before he begins another. The baker places no fresh bread in the oven until that already in it is thoroughly baked.

31. Rectification.—Let us imitate these people and take care not to confuse scholars who are learning grammar by teaching them dialectic, or by introducing rhetoric into their studies. We should also put off the study of Greek until Latin is mastered, since it is impossible to concentrate the mind on any one thing, when it has to busy itself with several things at once.

That great man, Joseph Scaliger, was well aware of this. It is related of him that (perhaps on the advice of his father) he never occupied himself with more than one branch of knowledge at once, and concentrated all his energies on that one. It was owing to this that he was able to master not only fourteen languages, but also all the arts and sciences that lie within the province of man. He devoted himself to these one after the other with such success that in each subject his learning excelled that of men who had given their whole lives to it. And those who have tried to follow in his footsteps and imitate his method, have done so with considerable success.

32. Schools, therefore, should be organised in such a manner that the scholar shall be occupied with only one object of study at any given time.

Fifth Principle

33. In all the operations of nature development is from within.

For example: in the case of a bird it is not the claws, or the feathers, or the skin that are first formed, but the
inner parts; the outer parts are formed later, at the proper season.

34. Imitation.—In the same way the gardener does not insert his graft into the outer bark nor into the outside layer of wood, but making an incision right into the pith, places the graft as far in as it will go.

In this way he makes the joint so firm that the sap cannot escape, but is forced right into the shoot, and uses all its strength in vivifying it.

35. So too, a tree, that is nourished by the rain of heaven and the moisture of the earth, assimilates its nourishment, not through its outer bark, but through the pores of its inmost parts. On this account the gardener waters, not the branches, but the roots. Animals also convey their food, not to their outer limbs, but to the stomach, which assimilates it and nourishes the whole body. If, therefore, the educator of the young give special attention to the roots of knowledge, the understanding, these will soon impart their vitality to the stem, that is, to the memory, and finally blossoms and fruits, that is to say, a facile use of language and practical capacity will be produced.

36. Deviation.—It is on this point that those teachers fall into error who, instead of thoroughly explaining the subjects of study to the boys under their charge, give them endless dictations, and make them learn their lessons off by heart. Even those who wish to explain the subject-matter do not know how to do so, that is to say, do not know how to tend the roots or how to engraft the graft of knowledge. Thus they fatigue their pupils, and resemble a man who uses a club or a mallet, instead of a knife, when he wishes to make an incision in a plant.

37. Rectification.—It therefore follows

(i.) That the scholar should be taught first to understand things, and then to remember them, and that no stress should be laid on the use of speech or pen, till after a training on the first two points.

(ii.) That the teacher should know all the methods by
which the understanding may be sharpened, and should put them into practice skilfully.

**Sixth Principle**

38. *Nature, in its formative processes, begins with the universal and ends with the particular.*

For example: a bird is to be produced from an egg. It is not the head, an eye, a feather, or a claw that is first formed, but the following process takes place. The whole egg is warmed; the warmth produces movement, and this movement brings into existence a system of veins, which mark in outline the shape of the whole bird (defining the parts that are to become the head, the wings, the feet, etc.). It is not until this outline is complete that the individual parts are brought to perfection.

39. *Imitation.*—The builder takes this as his model. He first makes a general plan of the building in his head, or on paper, or in wood. Then he lays the foundations, builds the walls, and lays on the roof. It is not until he has done this that he gives his attention to the small details that are necessary to complete a house, such as doors, windows, staircases, etc.; while last of all he adds ornamentation such as paintings, sculptures, and carpets.

40. An artist proceeds in the same way. He does not begin by drawing an ear, an eye, a nose, or a mouth, but first makes a charcoal sketch of the face or of the whole body. If he be satisfied that this sketch resembles the original, he paints it with light strokes of the brush, still omitting all detail. Then, finally, he puts in the light and shade, and, using a variety of colours, finishes the several parts in detail.

41. The procedure of the sculptor is the same. When he wishes to carve a statue, he takes a block of marble and shapes it roughly. Then he sets to work more carefully and outlines the most important features. Finally, he chisels the individual parts with the greatest accuracy and colours them artistically.
42. In the same way the gardener takes the most simple and universal part of a tree, namely, a shoot. Later on, this can put forth as many branches as it possesses buds.

43. Deviation.—From this it follows that it is a mistake to teach the several branches of science in detail before a general outline of the whole realm of knowledge has been placed before the student, and that no one should be instructed in such a way as to become proficient in any one branch of knowledge without thoroughly understanding its relation to all the rest.

44. It follows also that arts, sciences, and languages are badly taught unless a general notion of the elements be first given. I remember well that, when we began to learn dialectic, rhetoric, and metaphysics, we were, at the very beginning, overburdened with long-winded rules, with commentaries and notes on commentaries, with comparisons of authors and with knotty questions. Latin grammar was taught us with all the exceptions and irregularities; Greek grammar with all its dialects, and we, poor wretches, were so confused that we scarcely understood what it was all about.

45. Rectification.—The remedy for this want of system is as follows: at the very commencement of their studies, boys should receive instruction in the first principles of general culture, that is to say, the subjects learned should be arranged in such a manner that the studies that come later introduce nothing new, but only expand the elements of knowledge that the boy has already mastered. Just as a tree, even if it live for a hundred years, puts forth no new branches, but only suffers those that already exist to develop and to spread.

(i.) Each language, science, or art must be first taught in its most simple elements, that the student may obtain a general idea of it. (ii.) His knowledge may next be developed further by placing rules and examples before him. (iii.) Then he may be allowed to learn the subject systematically with the exceptions and irregularities; and (iv.), last of all, may
be given a commentary, though only where it is absolutely necessary. For he who has thoroughly mastered a subject from the beginning will have little need of a commentary, but will soon be in the position to write one himself.

**Seventh Principle**

46. *Nature makes no leaps, but proceeds step by step.*

The development of a chicken consists of certain gradual processes which cannot be omitted or deferred, until finally it breaks its shell and comes forth. When this takes place, the mother does not allow the young bird to fly and seek its food (indeed it is unable to do so), but she feeds it herself, and by keeping it warm with her body promotes the growth of its feathers. When the chick’s feathers have grown she does not thrust it forth from the nest immediately and make it fly, but teaches it first to move its wings in the nest itself or perching on its edge, then to try to fly outside the nest, though quite near it, by fluttering from branch to branch, then to fly from tree to tree, and later on from hill to hill, till finally it gains sufficient confidence to fly right out in the open. It is easy to see how necessary it is that each of these processes should take place at the right time; that not only the time should be suitable but that the processes should be graduated; and that there should be not graduation merely, but an immutable graduation.

47. *Imitation.*—The builder proceeds in the same manner. He does not begin with the gables or with the walls, but with foundations. When the foundations are laid he does not go on with the roof, but builds the walls. In a word, the order in which the several stages are combined depends on the relation that they mutually bear to one another.

48. The gardener likewise has to adopt the principle of graduation. The wild-stock must be found, dug up, transplanted, pruned, and cut; the graft must be inserted and the joint made firm, etc., and none of these processes can
be omitted or taken in a different order. But, if these processes are carried out properly and in the right order, it is scarcely possible, in fact it is impossible, for the result to be unsuccessful.

49. Deviation.—It is an evident absurdity, therefore, if teachers, for their own sake and that of their pupils, do not graduate the subjects which they teach in such a way that, not only one stage may lead on directly to the next, but also that each shall be completed in a given space of time. For unless goals are set up, means provided for reaching them, and a proper system devised for the use of those means, it is easy for something to be omitted or perverted, and failure is the result.

50. Rectification.—It follows therefore

(i.) That all studies should be carefully graduated throughout the various classes, in such a way that those that come first may prepare the way for and throw light on those that come after.

(ii.) That the time should be carefully divided, so that each year, each month, each day, and each hour may have its appointed task.

(iii.) That the division of the time and of the subjects of study should be rigidly adhered to, that nothing may be omitted or perverted.

Eighth Principle

51. If nature commence anything, it does not leave off until the operation is completed.

If a bird, urged by the impulse of nature, begin to sit on eggs, she does not leave off until she has hatched out the chickens. If she sat on them for a few hours only, the embryo in the egg would become cold and die. Even when the chickens are hatched she does not cease to keep them warm, but continues to do so until they have grown strong, are covered with feathers, and can endure the cold air.

52. Imitation.—The painter also, who has begun a picture, will produce his work best if he finish it without
any interruption. For in this case the colours blend better and hold faster.

53. For this reason it is best to finish the erection of a building without any interruption; otherwise the sun, the wind, and the rain spoil the work, the later additions will not be so firm, and on every side there will be cracks, weak spots, and loose joints.

54. The gardener too acts with wisdom, for when once he has begun to work at a graft he does not cease until the operation is completed. Since, if the sap dry in the stock or in the graft, owing to a delay in completing the process, the plant is ruined.

55. Deviation.—It is therefore injurious if boys are sent to school for months or years continuously, but are then withdrawn for considerable periods and employed otherwise; equally so if the teacher commence now one subject, now another, and finish nothing satisfactorily; and lastly, it is equally fatal if he do not fix a certain task for each hour, and complete it, so that in each period his pupil can make an unmistakable advance towards the desired goal. Where such a fire is wanting, everything grows cold. Not without reason does the proverb say “Strike while the iron is hot.” For if it be allowed to cool it is useless to hammer it, but it must once more be placed in the fire, and thus much time and iron are wasted. Since every time that it is heated, it loses some of its mass.

56. Rectification.—It follows therefore

(i.) That he who is sent to school must be kept there until he becomes well informed, virtuous, and pious.

(ii.) That the school must be situated in a quiet spot, far from noise and distractions.

(iii.) That whatever has to be done, in accordance with the scheme of study, must be done without any shirking.

(iv.) That no boys, under any pretext whatever, should be allowed to stay away or to play truant.
Ninth Principle

57. Nature carefully avoids obstacles and things likely to cause hurt.

For example, when a bird is hatching eggs it does not allow a cold wind, much less rain or hail, to reach them. It also drives away snakes, birds of prey, etc.

58. Imitation.—In the same way the builder, so far as is possible, keeps dry his wood, bricks, and lime, and does not allow what he has built to be destroyed or to fall down.

59. So, too, the painter protects a newly-painted picture from wind, from violent heat, and from dust, and allows no hand but his own to touch it.

60. The gardener also protects a young plant by a railing or by hurdles, that hares or goats may not gnaw it or root it up.

61. Deviation.—It is therefore folly to introduce a student to controversial points when he is just beginning a subject, that is to say, to allow a mind that is mastering something new to assume an attitude of doubt. What is this but to tear up a plant that is just beginning to strike root? (Rightly does Hugo say: "He who starts by investigating doubtful points will never enter into the temple of wisdom.") But this is exactly what takes place if the young are not protected from incorrect, intricate, and badly written books as well as from evil companions.

62. Rectification.—Care should therefore be taken

(i.) That the scholars receive no books but those suitable for their classes.

(ii.) That these books be of such a kind that they can rightly be termed sources of wisdom, virtue, and piety.

(iii.) That neither in the school nor in its vicinity the scholars be allowed to mix with bad companions.

63. If all these recommendations are observed, it is scarcely possible that schools should fail to attain their object.
CHAPTER XVII

THE PRINCIPLES OF FACILITY IN TEACHING AND IN LEARNING

1. We have already considered the means by which the educationist may attain his goal with certainty, we will now proceed to see how these means can be suited to the minds of the pupils, so that their use may be easy and pleasant.

2. Following in the footsteps of nature we find that the process of education will be easy

(i.) If it begin early, before the mind is corrupted.
(ii.) If the mind be duly prepared to receive it.
(iii.) If it proceed from the general to the particular.
(iv.) And from what is easy to what is more difficult.
(v.) If the pupil be not overburdened by too many subjects.

(vi.) And if progress be slow in every case.
(vii.) If the intellect be forced to nothing to which its natural bent does not incline it, in accordance with its age and with the right method.

(viii.) If everything be taught through the medium of the senses.
(ix.) And if the use of everything taught be continually kept in view.
(x.) If everything be taught according to one and the same method.

These, I say, are the principles to be adopted if education is to be easy and pleasant.
Fifth Principle

   For instance, for hatching a bird she selects fresh eggs and those that contain pure matter. If the formation of the chicken have already begun, it is in vain to expect any result.

4. Imitation.—The architect who wishes to erect a building, needs a clear plot of ground, and, if there be a house already standing there, he must pull it down before he can build the new one.

5. The artist, too, does his best work on a clean canvas. If it have already been painted on, or be dirty or rough, it must be cleaned or smoothed before he can use it.

6. For the preservation of precious ointments, empty jars must be procured, or those that are in use must be carefully cleansed of their contents.

7. The gardener, too, prefers to plant young trees, or, if he take them when too old, cuts off the branches in order that the sap may not be dissipated. For this reason Aristotle placed "privation" among the principles of nature, for he held that it was impossible to impress a new form on any material until the old one had been removed.

8. Deviation.—It follows from this: (1) That it is best to devote the mind to the pursuit of wisdom while it is still fresh, and before it has acquired the habit of dissipating its strength over a variety of occupations; and that the later the education begins, the harder it will be for it to obtain a hold, because the mind is already occupied by other things. (2) That the result must be bad if a boy be instructed by several teachers at once, since it is scarcely possible for them all to use the same method, and, if they do not, the boy's mind is drawn first in one direction and then in another, and its development is thus hindered. (3) That it shows great lack of judgment if moral instruction be not made the first point when the
education of children or of older boys is commenced; since, when they have been taught to control their feelings, they will be the more fit to receive other instruction. Horse-tamers keep a horse under absolute control with an iron bit, and ensure its obedience before they teach it its paces. Rightly does Seneca say: "First learn virtue, and then wisdom, since without virtue it is difficult to learn wisdom." And Cicero says: "Moral philosophy makes the mind fit to receive the seeds of further knowledge."

9. Rectification.—Therefore
(i.) Education should be commenced early.
(ii.) The pupil should not have more than one teacher in each subject.
(iii.) Before anything else is done, the morals should be rendered harmonious by the master's influence.

Second Principle

10. Nature prepares its material so that it actually strives to attain the form.

Thus the chicken in the egg, when sufficiently formed, seeks to develop itself still further, moves, and bursts the shell or breaks through it with its beak. After escaping from its prison, it takes pleasure in the warmth and nutriment provided by its mother, opens its beak expectantly and swallows its food greedily. It rejoices to find itself under the open sky, exercises its wings, and, later on, uses them with enjoyment; in a word, it displays a keen desire to fulfill all its natural functions, though throughout the whole process of development it advances step by step.

11. Imitation.—The gardener also must bring it about that the plant, properly provided with moisture and with warmth, take pleasure in its vigorous growth.

12. Deviation.—Therefore, those who drive boys to their studies, do them great harm. For what result can they expect? If a man have no appetite, but yet takes food when urged to do so, the result can only be sickness and
vomiting, or at least indigestion and indisposition. On the other hand, if a man be hungry, he is eager to take food, digests it readily, and easily converts it into flesh and blood. Thus Isocrates says: "He who is anxious to learn will also be learned." And Quintilian says: "The acquisition of knowledge depends on the will to learn, and this cannot be forced."

13. Rectification.—Therefore

(i.) The desire to know and to learn should be excited in boys in every possible manner.

(ii.) The method of instruction should lighten the drudgery of learning, that there may be nothing to hinder the scholars or deter them from making progress with their studies.

14. The desire to learn is kindled in boys by parents, by masters, by the school, by the subjects of instruction, by the method of teaching, and by the authority of the state.

15. By parents, if they praise learning and the learned in the presence of their children, or if they encourage them to be industrious by promising them nice books and clothes, or some other pretty thing; if they commend the teachers (especially him to whom they entrust their sons) as much for their friendly feeling towards the pupils as for their skill in teaching; (for love and admiration are the feelings most calculated to stimulate a desire for imitation); finally, if, from time to time, they send the child to him with a small present. In this way they will easily bring it about that the children like their lessons and their teachers, and have confidence in them.

16. By the teachers, if they are gentle and persuasive, and do not alienate their pupils from them by roughness, but attract them by fatherly sentiments and words; if they commend the studies that they take in hand on account of their excellence, pleasantness, and ease; if they praise the industrious ones from time to time (to the little ones they may give apples, nuts, sugar, etc.); if they call the children to them, privately or in the class, and show them pictures of the things that they must learn, or explain to them
optical or geometrical instruments, astronomical globes, and such-like things that are calculated to excite their admiration; or again, if they occasionally give the children some message to carry to their parents. In a word, if they treat their pupils kindly they will easily win their affections, and will bring it about that they prefer going to school to remaining at home.

17. The school itself should be a pleasant place, and attractive to the eye both within and without. Within, the room should be bright and clean, and its walls should be ornamented by pictures. These should be either portraits of celebrated men, geographical maps, historical plans, or other ornaments. Without, there should be an open place to walk and to play in (for this is absolutely necessary for children, as we shall show later), and there should also be a garden attached, into which the scholars may be allowed to go from time to time and where they may feast their eyes on trees, flowers, and plants. If this be done, boys will, in all probability, go to school with as much pleasure as to fairs, where they always hope to see and hear something new.

18. The subjects of instruction themselves prove attractive to the young, if they are suited to the age of the pupil and are clearly explained; especially if the explanation be relieved by a humorous or at any rate by a less serious tone. For thus the pleasant is combined with the useful.

19. If the method is to excite a taste for knowledge, it must, in the first place, be natural. For what is natural takes place without compulsion. Water need not be forced to run down a mountain-side. If the dam, or whatever else holds it back, be removed, it flows down at once. It is not necessary to persuade a bird to fly; it does so as soon as the cage is opened. The eye and the ear need no urging to enjoy a fine painting or a beautiful melody that is presented to them. In all these cases it is more often necessary to restrain than to urge on. The requisites of a natural method are evident from the preceding chapter and from the rules that follow.
In the second place, if the scholars are to be interested, care must be taken to make the method palatable, so that everything, no matter how serious, may be placed before them in a familiar and attractive manner; in the form of a dialogue, for instance, by pitting the boys against one another to answer and explain riddling questions, comparisons, and fables. But of this more in the proper place.

20. The civil authorities and the managers of schools can kindle the zeal of the scholars by being present at public performances (such as declarations, disputations, examinations, and promotions), and by praising the industrious ones and giving them small presents (without respect of person).

**Third Principle**

21. *Nature develops everything from beginnings which, though insignificant in appearance, possess great potential strength.*

For instance, the matter out of which a bird is to be formed consists of a few drops, which are contained in a shell, that they may be easily warmed and hatched. But these few drops contain the whole bird potentially, since, later on, the body of the chicken is formed from the vital principle which is concentrated in them.

22. *Imitation.*—In the same way a tree, no matter how large it may be, is potentially contained in the kernel of its fruit or in the shoot at the end of one of its branches. If one or the other of these be placed in the earth, a whole tree will be produced by the inner force that it contains.

23. *Terrible deviation.*—In direct opposition to this principle a terrible mistake is generally made in schools. Most teachers are at pains to place in the earth plants instead of seeds, and trees instead of shoots, since, instead of starting with the fundamental principles, they place before their pupils a chaos of diverse conclusions or the complete texts of authors. And yet it is certain that instruction rests on a very small number of principles, just as the earth is composed of four elements (though in
diverse forms); and that from these principles (in accordance with the evident limits of their powers of differentiation) an unlimited number of results can be deduced, just as, in the case of a tree, hundreds of branches, and thousands of leaves, blossoms, and fruits are produced from the original shoot. Oh! may God take pity on our age, and open some man's eyes, that he may see aright the true relations in which things stand to one another, and may impart his knowledge to the rest of mankind. With God's assistance I hope, in my Synopsis of Christian Wisdom, to give an earnest of my efforts to do so, in the modest hope that it may be of use to others whom God, in due season, may call to carry on the work.

24. Rectification.—In the meantime we may draw three conclusions:
   (i.) Every art must be contained in the shortest and most practical rules.
   (ii.) Each rule must be expressed in the shortest and clearest words.
   (iii.) Each rule must be accompanied by many examples, in order that the use of the rule may be quite clear when fresh cases arise.

Fourth Principle

25. Nature advances from what is easy to what is more difficult.

For example, the formation of an egg does not begin with the hardest part, the shell, but with the contents. These are at first covered by a membrane; it is not till later that the hard shell appears. The bird that learns to fly accustoms itself first to stand on its legs, then to move its wings gently, then to do so with more force until it can raise itself from the ground, and last of all gains sufficient confidence to fly through the air.

26. Imitation.—In the same way a carpenter's apprentice learns, first to fell trees, then to saw them into planks and fasten them together, and finally to build complete houses of them.
27. Various Deviations.—It is therefore wrong to teach the unknown through the medium of that which is equally unknown, as is the case:

(i.) If boys who are beginning Latin are taught the rules in Latin. This is just as if the attempt were made to explain Hebrew by Hebrew rules, or Arabic by Arabic rules.

(ii.) If these same beginners are given as assistance a Latin-German instead of a German-Latin dictionary. For they do not want to learn their mother-tongue by the aid of Latin, but to learn Latin through the medium of the language that they already know. (On this error we will say more in chap. xxii.).

(iii.) If boys are given a foreign teacher who does not understand their language. For if they have no common medium through which they can hold communication with him, and can only guess at what he is saying, can anything but a Tower of Babel be the result?

(iv.) A deviation is made from the right method of teaching, if boys of all nations (i.e. French, German, Bohemian, Polish, or Hungarian boys) are taught in accordance with the same rules of grammar (those of Melanchthon or of Ramus,²⁶ for example), since each of these languages stands in its own particular relation to Latin, and this relation must be well understood if Latin is to be thoroughly taught to boys of these several nationalities.

28. Rectification.—These errors may be avoided

(i.) If the teachers and their pupils talk the same language.

(ii.) If all explanations are given in the language that the pupils understand.

(iii.) If grammars and dictionaries are adapted to the language through the medium of which the new one is to be learned (that is to say, the Latin Grammar to the mother-tongue, and Greek Grammar to the Latin language).

(iv.) If the study of a new language be allowed to proceed gradually and in such a way that the scholar learn first to understand (for this is the easiest), then to write
THE PRINCIPLES OF FACILITY

(for here there is time for consideration), and lastly to speak (which is the hardest, because the process is so rapid).

(v.) If, when Latin is combined with German, the German be placed first as the best known, and the Latin follow.

(vi.) If the subject-matter be so arranged that the pupils get to know, first, that which lies nearest to their mental vision, then that which lies moderately near, then that which is more remote, and lastly, that which is farthest off. Therefore, if boys are being taught something for the first time (such as logic or rhetoric), the illustrations should not be taken from subjects that cannot be grasped by the scholars, such as theology, politics, or poetry, but should be derived from the events of everyday life. Otherwise the boys will understand neither the rules nor their application.

(vii.) If boys be made to exercise, first their senses (for this is the easiest), then the memory, then the comprehension, and finally the judgment. In this way a graded sequence will take place; for all knowledge begins by sensuous perception; then through the medium of the imagination it enters the province of the memory; then, by dwelling on the particulars, comprehension of the universal arises; while finally comes judgment on the facts that have been grasped, and in this way our knowledge is firmly established.

FIFTH PRINCIPLE

29. Nature does not overburden herself, but is content with a little.

For instance, she does not demand two chickens from one egg, but is satisfied if one be produced. The gardener does not insert a number of grafts on one stock, but two at most, if he consider it very strong.

30. Deviation.—The mental energies of the scholar are therefore dissipated if he have to learn many things
at once, such as grammar, dialectic, rhetoric, poetic, Greek, etc., in one year (cf. the previous chapter, Principle 4).

Sixth Principle

31. Nature does not hurry, but advances slowly.

For example, a bird does not place its eggs in the fire, in order to hatch them quickly, but lets them develop slowly under the influence of natural warmth. Neither, later on, does it cram its chickens with food that they may mature quickly (for this would only choke them), but it selects their food with care and gives it to them gradually in the quantities that their weak digestion can support.

32. Imitation.—The builder, too, does not erect the walls on the foundations with undue haste and then straightway put on the roof; since, unless the foundations were given time to dry and become firm, they would sink under the superincumbent weight, and the whole building would tumble down. Large stone buildings, therefore, cannot be finished within one year, but must have a suitable length of time allotted for their construction.

33. Nor does the gardener expect a plant to grow large in the first month, or to bear fruit at the end of the first year. He does not, therefore, tend and water it every day, nor does he warm it with fire or with quicklime, but is content with the moisture that comes from heaven and with the warmth that the sun provides.

34. Deviation.—For the young, therefore, it is torture

(i.) If they are compelled to receive six, seven, or eight hours' class instruction daily, and private lessons in addition.

(ii.) If they are overburdened with dictations, with exercises, and with the lessons that they have to commit to memory, until nausea and, in some cases, insanity is produced.

If we take a jar with a narrow mouth (for to this we may compare a boy's intellect) and attempt to pour a quantity of water into it violently, instead of allowing it to trickle in drop by drop, what will be the result? Without
doubt the greater part of the liquid will flow over the side, and ultimately the jar will contain less than if the operation had taken place gradually. Quite as foolish is the action of those who try to teach their pupils, not as much as they can assimilate, but as much as they themselves wish; for the faculties need to be supported and not to be overburdened, and the teacher, like the physician, is the servant and not the master of nature.

35. Rectification.—The ease and the pleasantness of study will therefore be increased:
(i.) If the class instruction be curtailed as much as possible, namely to four hours, and if the same length of time be left for private study.
(ii.) If the pupils be forced to memorise as little as possible, that is to say, only the most important things; of the rest they need only grasp the general meaning.
(iii.) If everything be arranged to suit the capacity of the pupil, which increases naturally with study and age.

Seventh Principle

36. Nature compels nothing to advance that is not driven forward by its own mature strength.

For instance, a chicken is not compelled to quit the egg before its limbs are properly formed and set; is not forced to fly before its feathers have grown; is not thrust from the nest before it is able to fly well, etc.

A tree, too, does not put forth shoots before it is forced to do so by the sap that rises from the roots, nor does it permit fruit to appear before the leaves and blossoms formed by the sap seek further development, nor does it permit the blossoms to fall before the fruit that they contain is protected by a skin, nor the fruit to drop before it is ripe.

37. Deviation.—Now the faculties of the young are forced:
(i.) If boys are compelled to learn things for which their age and capacity are not yet suited.
(ii.) If they are made to learn by heart or to do things that have not first been thoroughly explained and demonstrated to them.

38. **Rectification.**—From what has been said, it follows

(i.) That nothing should be taught to the young, unless it is not only permitted but actually demanded by their age and mental strength.

(ii.) That nothing should be learned by heart that has not been thoroughly grasped by the understanding. Nor should any feat of memory be demanded unless it is absolutely certain that the boy's strength is equal to it.

(iii.) That nothing should be set boys to do until its nature has been thoroughly explained to them, and rules for procedure have been given.

**Eighth Principle**

39. *Nature assists its operations in every possible manner.*

For example, an egg possesses its own natural warmth; but this is assisted by the warmth of the sun and by the feathers of the bird that hatches it. God, the father of nature, takes forethought for this. The newly-hatched chicken, also, is warmed by the mother as long as is necessary, and is trained by her in the various functions of life. This we can see in the case of storks, who assist their young by taking them on their backs and bearing them round the nest while they exercise their wings. In the same way nurses help little children. They teach them first to raise their heads and then to sit up; later on, to stand on their legs, and to move their legs preparatory to walking; then by degrees to walk and step out firmly. When they teach them to speak they repeat words to them and point to the objects that the words denote.

40. **Deviation.**—It is therefore cruelty on the part of a teacher if he set his pupils work to do without first explaining it to them thoroughly, or showing them how it should be done, and if he do not assist them in their first attempts; or if he allow them to toil hard, and
then loses his temper if they do not succeed in their endeavours.

What is this but to torture the young? it is just as if a nurse were to force a child to walk, while it is still afraid to stand on its legs, and beat it when it failed to do so. Nature's teaching is very different, and shows that we ought to have patience with the weak as long as their strength is insufficient.

41. Rectification.—From this it follows:

(i.) That no blows should be given for lack of readiness to learn (for, if the pupil do not learn readily, this is the fault of no one but the teacher, who either does not know how to make his pupil receptive of knowledge or does not take the trouble to do so).

(ii.) That the subjects that have to be learned by the pupils should be so thoroughly explained to them, that they can understand them as well as they understand their five fingers.

(iii.) That, as far as is possible, instruction should be given through the senses, that it may be retained in the memory with less effort.

42. For example, the sense of hearing should always be conjoined with that of sight, and the tongue should be trained in combination with the hand. The subjects that are taught should not merely be taught orally, and thus appeal to the ear alone, but should be pictorially illustrated, and thus develope the imagination by the help of the eye. Again, the pupils should learn to speak with their mouths and at the same time to express what they say with their hands, that no study may be proceeded with before what has already been learned is thoroughly impressed on the eyes, the ears, the understanding, and the memory. With this object, it is desirable to represent pictorially, on the walls of the class-room, everything that is treated of in the class, by putting up either precepts and rules or pictures and diagrams illustrative of the subjects taught. If this be done, it is incredible how much it assists a teacher to impress his instruction on the
pupils' minds. It is also useful if the scholars learn to write down in their note-books or among their collections of idioms everything that they hear or read, since in this way the imagination is assisted and it is easier to remember them later on.

**Ninth Principle**

43. *Nothing is produced by nature of which the practical application is not soon evident.*

For example, when a bird is formed it is soon evident that the wings are intended for flying and the legs for running. In the same way every part of a tree has its use, down to the skin and the bloom that surround the fruit.

Therefore

44. *Imitation.*—The task of the pupil will be made easier, if the master, when he teaches him anything, show him at the same time its practical application in every-day life. This rule must be carefully observed in teaching languages, dialectic, arithmetic, geometry, physics, etc. If it be neglected, the things that you are explaining will seem to be monsters from the new world, and the attitude of the pupil, who is indifferent whether they exist or no, will be one of belief rather than of knowledge. When things are brought under his notice and their use is explained to him, they should be put into his hands that he may assure himself of his knowledge and may derive enjoyment from its application.

Therefore

45. Those things only should be taught whose application can be easily demonstrated.

**Tenth Principle**

46. *Nature is uniform in all its operations.*

For instance, the production of all birds, and, indeed, of all living creatures, resembles that of any single bird
which you may choose. It is only in the minor details that there are differences. So too in the case of plants, the development of one plant from its seed, the planting and the growth of a single tree, serve as illustrations of the way in which all the others, without exception, develop. One leaf on a tree resembles all the others, and in this respect does not change from year to year.

47. Deviation.—Differences of method, therefore, confuse the young, and make their studies distasteful to them, since not only do different teachers use different systems, but even individual teachers vary their method. For example, languages are taught in one way, dialectic in another, though both might be brought under the same method, in accordance with the harmony of the universe, and the universal and intimate relations that exist between objects and words.

48.—Rectification.—Henceforth, therefore

(i.) The same method of instruction must be used for all the sciences, the same for all the arts, and the same for all languages.

(ii.) In each school the same arrangement and treatment should be adopted for all studies.

(iii.) The class-books for each subject should, as far as is possible, be of the same edition.

In this way difficulties will be avoided and progress will be made easy.
CHAPTER XVIII

THE PRINCIPLES OF THOROUGHNESS IN TEACHING AND IN LEARNING

1. It is a common complaint that there are few who leave school with a thorough education, and that most men retain nothing but a veneer, a mere shadow of true knowledge. This complaint is corroborated by facts.

2. The cause of this phenomenon appears on investigation to be twofold: either that the schools occupy themselves with insignificant and unimportant studies, to the neglect of those that are more weighty, or that the pupils forget what they have learned, since most of it merely goes through their heads and does not stick fast there. This last fault is so common that there are few who do not lament it. For if everything that we have ever read, heard, and mentally appreciated were always ready to hand in our memories, how learned we should appear! We do, it is true, make practical use of much that we have learned, but the amount that we recollect is unsatisfactory, and the fact remains that we are continually trying to pour water into a sieve.

3. But can no cure be found for this? Certainly there can, if once more we go to the school of nature, and investigate the methods that she adopts to give endurance to the beings which she has created.

I maintain that a method can be found by means of which each person will be enabled to bring into his mental consciousness not only what he has learned, but more as
well; since he will recall with ease all that he has learned from teachers or from books, and, at the same time, will be able to pass sound judgment on the objective facts to which his information refers.

4. This will be possible:
   (i.) If only those subjects that are of real use be taken in hand.
   (ii.) If these be taught without digression or interruption.
   (iii.) If a thorough grounding precede instruction in detail.
   (iv.) If this grounding be carefully given.
   (v.) If all that follows be based on this grounding, and on nothing else.
   (vi.) If, in every subject that consists of several parts, these parts be linked together as much as possible.
   (vii.) If all that comes later be based on what has gone before.
   (viii.) If great stress be laid on the points of resemblance between cognate subjects.
   (ix.) If all studies be arranged with reference to the intelligence and memory of the pupils, and the nature of language.
   (x.) If knowledge be fixed in the memory by constant practice.

We will now consider each of these principles in detail.

First Principle

5. Nature produces nothing that is useless.

For example, nature, when commencing to form a bird, does not give it scales, gills, horns, four feet, or any other organs that it cannot use, but supplies a head, a heart, wings, etc. In the same way a tree is not given ears, eyes, down, or hair, but bark, bast, wood, and roots.

6. Imitation in the arts.—In the same way no one who wishes to grow fruit in his fields, orchards, and gardens, plants them with weeds, nettles, thistles, and thorns, but with good seeds and plants.
7. The builder, also, who wishes to erect a well-built house, does not collect straw, litter, dirt, or brushwood, but stones, bricks, oak planks, and similar materials of good quality.

8. And in schools.—In schools therefore
   (i.) Nothing should be studied, unless it be of undoubted use in this world and in the world to come,—its use in the world to come being the more important (Jerome reminds us that knowledge, that is to be of service to us in heaven, must be acquired on earth).
   (ii.) If it be necessary to teach the young much that is of value solely in this world (and this cannot be avoided), care must be taken that while a real advantage is gained for our present life, our heavenly welfare be not hindered thereby.

9. Why then pursue worthless studies? What object is there in learning subjects that are of no use to those who know them and the lack of which is not felt by those who do not know them? subjects, too, which are certain to be forgotten as time passes on and the business of life becomes more engrossing? This short life of ours has more than enough to occupy it, even if we do not waste it on worthless studies. Schools must therefore be organised in such a way that the scholars learn nothing but what is of value (the value and importance of recreation will be treated of in the right place).

Second Principle

10. When bodies are being formed, nature omits nothing that is necessary for their production.

   For example: in the formation of a bird, nature does not forget the head, the wings, the legs, the claws, the skin, or anything, in short, that is an essential part of a winged being of this kind.

11. Imitation in schools.—In the same way schools, when they educate men, must educate them in every way, and suit them not only for the occupations of this life,
but for eternity as well. Indeed it is with a view to the future life that all strenuous human effort should be undertaken.

12. Not the sciences alone, therefore, should be taught in schools, but morality and piety as well. Now a training in the sciences improves the understanding, the faculty of speech, and manual dexterity, so that everything that is of use can be suitably considered, discussed, and put into practice. If any one of these elements be omitted, a great gap is left, and, as result, not only is the education defective but the stability of the whole is endangered. Nothing can be stable unless all its parts are in intimate connection with one another.

Third Principle

13. Nature does not operate on anything, unless it possess a foundation or roots.

A plant does not shoot upwards before it has taken root, and would wither and die if it tried to do so. For this reason a clever gardener does not insert a graft unless he sees that the stock has taken root.

In the case of birds and beasts we find, in the place of roots, the intestines (for in these the vitality is situated), and this part of the body is the first to be formed, being, as it were, the foundation of the rest.

14. Imitation.—In the same way an architect does not build a house without first laying a solid foundation, since otherwise the whole structure would soon fall down. Similarly an artist paints a foundation of colour before he puts in the fine shades; otherwise the colours would easily crack and fade.

15. Deviation.—The laying of such a foundation for their instruction is neglected by those teachers (1) who take no trouble to make their pupils diligent and attentive, and (2) who do not begin by giving a general idea of the whole course of study, so that the pupils may realise how much of the scheme projected is actually got through.
For if the scholars perform their work without inclination, without attention, and without intelligence, how can any lasting result be expected?

16. Rectification.—Therefore

(i.) Every study should be commenced in such a manner as to awaken a real liking for it on the part of the scholars, and this should be done by proving to them how excellent, useful, pleasant, and otherwise desirable it is.

(ii.) A general notion of the language or art (consisting of a sketch, as slight as is possible, but yet embracing every branch of the subject in question) should be given to the pupil before the detailed consideration of the subject is proceeded with, in order that he may thus, at the very beginning, realise its aims, limits, and internal structure. For as the skeleton is the foundation of the whole body, so the general sketch of an art is the foundation of the whole art.

Fourth Principle

Thus, the entrails of an animal are buried deep in its body. The deeper a tree strikes its roots, the firmer it will stand; while if the roots only just penetrate beneath the turf it is easily rooted up.

18. Correction of the deviation.—It follows, therefore, that the desire to learn should be thoroughly awakened in the pupils, and that the general conception of the subject should be thoroughly got into their heads. Until this has been carefully done a more detailed exposition of the art or language should not be attempted.

Fifth Principle

19. Nature develops everything from its roots and from no other source.

The wood, bark, leaves, flowers, and fruit of a tree come from the roots and from no other source. For although
the rain may fall on the tree and the gardener may water it, the moisture must all be taken up through the roots, and then dispersed through the trunk, branches, boughs, leaves, and fruit. On this account the gardener, though he takes his graft from some other source, must let it into the stock in such a way that it may become incorporated with it, absorb moisture from its roots, and, nourished in this way, be capable of development. It is from the roots that a tree derives everything, and there is no necessity to supply leaves and branches from any other source. It is just the same when a bird is to be clothed with feathers. They are not taken from another bird, but grow from the innermost part of the body.

20. *Imitation in the arts.*—The prudent builder, too, erects a house in such a way that it can stand securely on its own foundations and can be supported by its own beams, without the need of any external props. For, if a building need external support, this is a proof of incompleteness and of a tendency to fall down.

21. When a man lays out a fishpond or a lake he finds a spring, and, by means of canals and pipes, conducts its water to his reservoir; but he does not allow water to flow in from any other source, nor does he use rain-water.

22. From this precept it follows that the proper education of the young does not consist in stuffing their heads with a mass of words, sentences, and ideas dragged together out of various authors, but in opening their understanding to the outer world, so that a living stream may flow from their own minds, just as leaves, flowers, and fruit spring from the buds on a tree, while in the following year a fresh bud is again formed and a fresh shoot, with its leaves, flowers, and fruit, grows from it.

23. *Terrible deviation in schools.*—Hitherto the schools have not taught their pupils to develop their minds like young trees from their own roots, but rather to deck themselves with branches plucked from other trees, and, like Æsop's crow, to adorn themselves with the feathers of other birds; they have taken no trouble to open the
fountain of knowledge that is hidden in the scholars, but instead have watered them with water from other sources. That is to say, they have not shown them the objective world as it exists in itself, but only what this, that, or the other author has written or thought about this or that object, so that he is considered the most learned who best knows the contradictory opinions which many men have held about many things. The result is that most men possess no information but the quotations, sentences, and opinions that they have collected by rummaging about in various authors, and thus piece their knowledge together like a patchwork quilt. "Oh you imitators, you slavish pack!" cries Horace. A slavish pack indeed, and accustomed to carry burdens that are not their own.

24. But why, I ask you, do we allow ourselves to be led astray by the opinions of other men, when what is sought is a knowledge of the true nature of things? Have we nothing better to do than to follow others to their cross-roads and down their by-ways, and to study attentively the deviation that each makes from the right path? O brother mortals! let us hasten to the goal and give up this idle wandering. If our goal be firmly set before us, why should we not hasten to it by the shortest road; why should we use the eyes of other men in preference to our own?

25. The methods by which all branches of knowledge are taught show that it really is the schools that are to blame for this; that they really teach us to see by means of the eyes of others, and to become wise by employing their brains. For these methods do not teach us to discover springs and conduct streams of water from them, but place before us the water that has been drawn off from various authors and teach us to return from these to the springs. For the dictionaries (at least so far as I know, though perhaps with the exception of the one by Cnapius, but even in this one there are some things left to be desired, as will be shown in chap. xxii.) do not teach how to speak but only how to understand; the grammars do not teach how to construct sentences but only how to
dissect them; and no vulgarity gives any assistance towards joining the phrases skilfully together in conversation, or towards ringing changes on them, but only provides a haphazard collection of sentences. Scarcely any one teaches physics by ocular demonstration and by experiment, but only by quoting the works of Aristotle and of others. No one seeks to form the morals by working on the inward sources of action, but by purely external explanations and analysis of the virtues a superficial veneer of morality is given. This will be more evident when I come to the special methods of the arts and languages, but still more so, please God, when I give the outline of my Pansophia.

26. It is really to be wondered at that the men of former times did not understand this better, or that this error has not long since been rectified by those of the present day; since it is certain that we have here the actual reason why such slow progress has hitherto been made. Does the builder teach his apprentice the art of building by pulling down a house? Oh no; it is during the process of building a house that he shows him how to select his materials, how to fit each stone into its proper place, how to prepare them, raise them, lay them and join them together. For he who understands how to build will not need to be shown how to pull down, and he who can sew a garment together will be able to unrip it without any instruction. But it is not by pulling down houses or by unripping garments that the arts of building or of tailoring can be learned.

27. It is only too evident that the methods which are so faulty in this respect have not been rectified (1) since the education of many, if not of most men, consists of nothing but a string of names; that is to say, they can repeat the technical terms and the rules of the arts, but do not know how to apply them practically; (2) since the education of no man attains the position of universal knowledge that can give itself support, strength, and breadth, but is a heterogeneous compound of which one part is borrowed from one source and another from
another, whose elements are joined together on no logical principle, and which therefore bears no worthy fruit. For the knowledge that consists of the collected sayings and opinions of various authors resembles the tree which peasants erect when they make holiday, and which, though covered with branches, flowers, fruit, garlands, and crowns, cannot grow or even last, because its ornamentation does not spring from its roots, but is only hung on. Such a tree bears no fruit, and the branches that are attached to it wither and fall off. But a man who is thoroughly educated resembles a tree which grows from its own roots and is nourished by its own sap, and which, on that account, increases in size (and from day to day with more vigour), and puts forth leaves, blossoms, and fruits.

28. Rectification.—We arrive therefore at the following conclusion: men must, as far as is possible, be taught to become wise by studying the heavens, the earth, oaks, and beeches, but not by studying books; that is to say, they must learn to know and investigate the things themselves, and not the observations that other people have made about the things. We shall thus tread in the footsteps of the wise men of old, if each of us obtain his knowledge from the originals, from things themselves, and from no other source. We may therefore lay it down as a law:

(i.) That all knowledge should be deduced from the unchanging principles of the subject in question.

(ii.) That no information should be imparted on the grounds of bookish authority, but should be authorised by actual demonstration to the senses and to the intellect.

(iii.) That in dealing with any subject the analytic method should never be used exclusively; in fact, preponderance should rather be given to the synthetic method.

**Sixth Principle**

29. The more the uses to which nature applies anything, the more distinct subdivisions that thing will possess.

For instance, the greater the number of joints into
THOROUGHNESS IN TEACHING AND LEARNING

which the limbs of any animal are divided, the more complex will be its movements, as we can see if we compare a horse with a snake. In the same way a tree stands more firmly and is more picturesque if its branches and roots spread out well and stand away from one another.

30. *Imitation.*—In the education of the young, care should be taken that everything that is taught be carefully defined and kept in its place, so that not only the teacher, but the pupil as well, may know exactly what progress he has made and what he is actually doing. It will also be of great assistance if all the books that are used in schools follow nature’s example in this respect.

**Seventh Principle**

31. *Nature never remains at rest, but advances continually; never begins anything fresh at the expense of work already in hand, but proceeds with what she has begun, and brings it to completion.*

For instance, in the formation of the embryo, it is the feet, the head, and the heart that come first into existence, and these organs are not discarded but are perfected. A tree which is transplanted does not cast the branches that have previously grown upon it, but continues to provide them with sap and vitality, that with each successive year they may put forth more shoots.

32. *Imitation.*—In schools therefore

(i.) All the studies should be so arranged that those which come later may depend on those that have gone before, and that those which come first may be fixed in the mind by those that follow.

(ii.) Each subject taught, when it has been thoroughly grasped by the understanding, must be impressed on the memory as well.

33. For since, in this natural method of ours, all that precedes should be the foundation of all that comes after, it is absolutely essential that this foundation be thoroughly laid. For that only which has been thoroughly understood,
and committed to memory as well, can be called the property of the mind.

Truly does Quintilian say: “The acquisition of knowledge depends on the memory. Instruction is in vain if we forget what we hear or read.” Ludovicus Vives also says: “The memory should be exercised in early youth, since practice develops it, and we should therefore take care to practise it as much as possible. Now, in youth, the labour is not felt, and thus the memory develops without any trouble and becomes very retentive.” And in the Introduction to Philosophy he says: “The memory should not be permitted to rest, for there is no faculty that acts with greater readiness or develops more through action. Commit something to memory daily, for the more you commit to memory the more faithfully it will be retained, and the less, the less faithfully.” The example of nature shows us that this is true. The more sap a tree sucks up, the stronger it grows, and, conversely, the stronger it grows, the more sap it pours through its fibres. An animal also develops in proportion to the strength of its digestion, and, conversely, the larger it grows the more nourishment it requires and the more it digests. This is the characteristic of every natural body that develops. In this respect, therefore, children should not be spared (though of course no over-pressure should be applied), for the foundations of unfailing progress will thus be laid.

Eighth Principle

34. Nature knits everything together in continuous combination.

For instance, when a bird is formed, limb is joined to limb, bone to bone, and sinew to sinew. So too in the case of a tree, the trunk is joined to the roots, the branches to the trunk, the young shoots to the branches, the buds to the shoots, and to these again the leaves, flowers, and fruits; so that, though there may be thousands of each, the whole constitutes one tree. So with a house, if it is to be durable, the walls must rest on the foundations, the ceilings and the
roof upon the walls, and, in short, all the parts, from the largest to the smallest, must be connected and fitted together, so that they form a single house.

35. *Imitation.*—From this it follows:

(i.) That the studies of a lifetime should be so arranged that they form an encyclopædic whole, in which all the parts spring from a common source and each is in its right place.

(ii.) That everything taught should be supported by good reasons, so that no easy entrance may be given either for doubt or for forgetfulness.

Indeed these reasons are the nails, the clasps, and the clamps that hold an object fast in the memory and prevent it from fading away.

36. Now, to strengthen all information by giving reasons is equivalent to explaining things by their causes. That is to say, not only the nature of each object is pointed out but also the reason why it cannot be otherwise. For knowledge is nothing but the acquaintance with an object that we gain by mastering its causes. For instance, if the question arose whether it would be more correct to say *totus populus* or *cunctus populus*, and the teacher were merely to say "*cunctus populus* is the right phrase," but omitted to give any reason, the pupil would soon forget it. If, on the other hand, he were to say "*Cunctus* is a contraction for *conjectus*," and therefore *totus* should be used when the object denoted is homogeneous, *cunctus* when the conception is collective, as here," it is scarcely conceivable that the pupil could forget it, unless his intelligence were very limited. Again, if the grammatical question were to arise why we say *mea refert*, *tua refert*, but *ejus refert*; that is to say, why we use the ablative (as it is supposed to be) in the first and second persons, but the genitive in the third person; if I were to answer, that *refert* is a contraction for *res fert*, and that the phrases are therefore *mea res fert*, *tua res fert*, *ejus res fert* (or in their contracted form *mea refert*, *tua refert*, *ejus refert*), and that therefore *mea* and *tua* are not the ablative but the nominative, would not the pupil be stimulated to further efforts?
The scholars, therefore, should learn, and learn thoroughly, the etymology of all words, the reasons for all constructions, and the principles on which the rules for the various subjects of study have been formed (the principles of the sciences should in the first instance be impressed on the mind, not by merely giving the reasons, but by actual demonstration on the objects themselves).

This will prove most congenial to the pupils, and will therefore be of the greatest use in paving the way for the most thorough education possible; for their eyes will be opened to a remarkable extent, and they will acquire the habit of easily and naturally advancing from one thing to another.

37. In schools, therefore, everything should be taught through its causes.

Ninth Principle

38. Nature preserves a due proportion between the roots and the branches, with respect to both quality and quantity.

The development of the branches above the earth is proportionate to that of the roots beneath. This could not be otherwise; for if the tree were only to grow upwards it would be unable to maintain its erect position, since it is the roots that help it to do so. If, on the other hand, it only grew downwards it would be useless, for it is the branches and not the roots that bear the fruit. With animals also there is a close connection between the external and the internal organs, for if the internal organs are healthy the external ones are so also.

39. Imitation.—The same holds good of education. It must first be applied to the inner roots of knowledge, and thus develope and gain strength, while at the same time care must be taken that it afterwards spread out into branches and foliage. That is to say, whenever instruction is given the pupil should be taught to apply his knowledge practically, as in the case of a language by speaking, and not merely to assimilate it mentally.
40. Therefore

(i.) With every subject of instruction the question of its practical use must be raised, that nothing useless may be learned.

(ii.) Whatever has been learned should be communicated by one pupil to the other, that no knowledge may remain unused. For in this sense only can we understand the saying: “Thy knowledge is of no avail if none other know that thou knowest.” No source of knowledge, therefore, should be opened, unless rivulets flow from it. But of this will say more in the following principle.

**Tenth Principle**

41. *Nature becomes fruitful and strong through constant movement.*

Thus, when a bird hatches eggs, it does not only warm them, but, in order that they may be warmed equally on all sides, it turns them round daily (this can be easily observed in the case of geese, hens, and doves, since these hatch their eggs under our very eyes). When the chicken has broken through the shell it exercises itself by moving its beak, its limbs, and its wings, by stretching itself and raising itself from the ground, and by repeated attempts to walk and to fly, until it is sufficiently strong to do so.

The more a tree is buffeted by the winds, the faster it grows and the deeper it drives its roots. Indeed it is healthy for all plants to be stimulated by rain, storms, hail, thunder, and lightning, and for this reason those localities that are greatly exposed to storms of wind and of rain ought to produce harder wood than others.

42. *Imitation in the mechanical arts.*—In the same way the builder leaves the wind and the sun to make his buildings dry and firm. The smith also, who wishes to harden and temper his iron, places it repeatedly in the fire and in water, and thus, by alternating cold and heat, and by repeatedly softening the metal, ultimately renders it hard and durable.
43. From this it follows that education cannot attain to thoroughness without frequent and suitable repetitions of and exercises on the subjects taught. We may learn the most suitable mode of procedure by observing the natural movements that underlie the processes of nutrition in living bodies, namely those of collection, digestion, and distribution. For in the case of an animal (and in that of a plant as well) each member seeks for digestion food which may both nurture that member (since this retains and assimilates part of the digested food) and be shared with the other members, that the well-being of the whole organism may be preserved (for each member serves the other). In the same way that teacher will greatly increase the value of his instruction who

(i.) Seeks out and obtains intellectual food for himself.

(ii.) Assimilates and digests what he has found.

(iii.) Distributes what he has digested, and shares it with others.

44. These three elements are to be found in the well-known Latin couplet:—

To ask many questions, to retain the answers, and to teach what one retains to others;

These three enable the pupil to surpass his master.

Questioning takes place when a pupil interrogates his teachers, his companions, or his books about some subject that he does not understand. Retention follows when the information that has been obtained is committed to memory, or is written down for greater security (since few are so fortunate as to possess the power of retaining everything in their minds). Teaching takes place when knowledge that has been acquired is communicated to fellow-pupils or other companions.

With the two first of these principles the schools are quite familiar, with the third but little; its introduction, however, is in the highest degree desirable. The saying, "He who teaches others, teaches himself," is very true, not
only because constant repetition impresses a fact indelibly on the mind, but because the process of teaching in itself gives a deeper insight into the subject taught. Thus it was that the gifted Joachim Fortius\textsuperscript{29} used to say that, if he had heard or read anything once, it slipped out of his memory within a month; but that if he taught it to others it became as much a part of himself as his fingers, and that he did not believe that anything short of death could deprive him of it. His advice, therefore, was that, if a student wished to make progress, he should arrange to give lessons daily in the subjects which he was studying, even if he had to hire his pupils. “It is worth your while,” he says, “to sacrifice your bodily comfort to a certain extent for the sake of having some one who will listen while you teach, or, in other words, while you make intellectual progress.”

45. This would certainly be of use to many and could easily be put into practice if the teacher of each class would introduce this excellent system to his pupils. It might be done in the following way: in each lesson, after the teacher has briefly gone through the work that has been prepared, and has explained the meanings of the words, one of the pupils should be allowed to rise from his place and repeat what has just been said in the same order (just as if he were the teacher of the rest), to give his explanations in the same words, and to employ the same examples, and if he make a mistake he should be corrected. Then another can be called up and made go through the same performance while the rest listen. After him a third, a fourth, and as many as are necessary, until it is evident that all have understood the lesson and are in a position to explain it. In carrying this out great care should be taken to call up the clever boys first, in order that, after their example, the stupid ones may find it easier to follow.

46. Exercises of this kind will have a fivefold use.

(i.) The teacher is certain to have attentive pupils. For since the scholars may, at any time, be called up and asked to repeat what the teacher has said, each of them will be afraid of breaking down and appearing ridiculous
before the others, and will therefore attend carefully and allow nothing to escape him. In addition to this, the habit of brisk attention, which becomes second nature if practised for several years, will fit the scholar to acquit himself well in active life.

(ii.) The teacher will be able to know with certainty if his pupils have thoroughly grasped everything that he has taught them. If he finds that they have not, he will consult his own interest as well as that of his pupils by repeating his explanation and making it clearer.

(iii.) If the same thing be frequently repeated, the dullest intelligences will grasp it at last, and will thus be able to keep pace with the others; while the brighter ones will be pleased at obtaining such a thorough grip of the subject.

(iv.) By means of such constant repetition the scholars will gain a better acquaintance with the subject than they could possibly obtain by private study, even with the greatest diligence, and will find that, if they just read the lesson over in the morning and then again in the evening, it will remain in their memories easily and pleasantly. When, by this method of repetition, the pupil has, as it were, been admitted to the office of teacher, he will attain a peculiar keenness of disposition and love of learning; he will also acquire the habit of remaining self-possessed while explaining anything before a number of people, and this will be of the greatest use to him throughout life.

47. Following out this idea, the scholars, when they meet one another after school hours, or when they go for walks together, should compare notes and discuss information that they have recently acquired, or should converse on anything new that attracts their attention. It would be of great assistance, when a certain number of scholars meet for such discussion, if one of them (to be chosen either by lot or by vote) were to take the place of teacher, and control the proceedings. If the scholar thus selected by his companions refuse the position, he should be severely reprimanded. For, far from being rejected, such
opportunities of teaching and of learning should be sought after and competed for.

Of written exercises (a great help to progress) we will speak in our chapters on the Vernacular-School and on the Latin-School (chaps. xxvii. and xxviii.).
CHAPTER XIX

THE PRINCIPLES OF CONCISENESS AND RAPIDITY IN TEACHING

I. "But these projects are too wearisome and too comprehensive," many readers will here remark. "What a number of teachers and of libraries, and how much labour will be necessary in order that thorough instruction may be given in one subject!" I answer: This is undoubtedly so, and unless our labours are shortened the task will be no easy one; for this art of ours is as long, as wide, and as deep as the universe that has to be subdued by our minds. But who does not know that diffuse and difficult things can be brought into a small compass? who is ignorant that weavers can weave together a hundred thousand threads with the greatest rapidity, and can produce from these a great variety of stuffs? or that millers can grind thousands of grains with the greatest ease, and can separate the bran from the flour with great exactness and without any difficulty? Every one knows that engineers, without the slightest trouble and with comparatively small machines, can raise enormous weights, and that a weight of one ounce, if at a sufficient distance from the fulcrum of a lever, can counterbalance many pounds.

We see, therefore, that great achievements are more often a question of skill than of strength. Are learned men then to be the only people who do not know how to conduct their affairs with skill? Surely shame should compel us to emulate the inventive spirit of other profes-
sions and find a remedy for the difficulties with which schools have hitherto struggled.

2. It is impossible to find a remedy until we have discovered the diseases and their causes. What can it be that has impeded the efforts of the schools and hindered their success to such an extent that most men during their whole stay at school do not traverse the whole range of the sciences and arts, while some of them scarcely even cross the threshold?

3. The causes of this are undoubtedly the following: firstly, no fixed landmarks were set up, which might serve as goals to be reached by the scholars at the end of each year, month, or day, and there was a complete lack of system.

4. Secondly, the roads that would infallibly lead to these goals were not pointed out.

5. Thirdly, things that should naturally be associated were not joined together, but were kept apart. For instance, the scholars in elementary schools were taught to read, but were not given lessons in writing till some months afterwards. In the Latin-School boys were allowed to spend some years in learning words without any reference to their meanings, so that their boyhood was wholly occupied by grammatical studies, and all philosophic interest was reserved for a later period. In the same way the scholars were only allowed to learn, never to teach, though all these things (reading and writing, words and things, learning and teaching) should be associated, just as, in running, the raising of the feet is combined with the setting of them on the ground again, or, in conversation, listening is combined with answering, or, in playing ball, throwing is combined with catching.

6. Fourthly, the arts and the sciences were scarcely ever taught as part of an encyclopædic whole, but were dealt out piece-meal. This has been the reason why, in the eyes of the scholars, they seemed like a heap of wood or of faggots, in which the exact connection and combining-links can scarcely be discerned. Thus it came to pass
that some grasped one fact, others another, and that none received a really thorough and universal education.

7. Fifthly, many different methods were employed. Each school and even each teacher used a different one. What was worse, teachers would use one method in one subject or language, and another in another, and, worst of all, even in one individual subject they varied their method, so that the scholar scarcely understood in what way he was expected to learn. This was the cause of the many delays that took place, and of the lassitude of the scholar, who had frequently no desire even to attempt new branches of study.

8. Sixthly, no method was known by which instruction could be given to all the pupils in a class at the same time; the individual only was taught. With a large number of pupils this must have been an impossible task for the teacher. The pupils also must have found it very wearisome and extremely irksome, if each had to go on preparing work until his turn arrived.

9. Seventhly, if there were several teachers, this was a fresh source of confusion; since each hour some new subject was introduced. Not to mention the fact that a diversity of teachers tends to distract the mind quite as much as a diversity of books.

10. Finally, both in school and out of it, the scholars had perfect freedom as regards the books they read, and the teachers gave them no assistance in their choice. For all were imbued with the idea that to read many authors afforded many opportunities of making progress, whereas such diversity produced nothing but distraction. It was not surprising, therefore, that very few mastered all the branches of study. The wonder was that any one was able to find his way out of such a labyrinth,—and indeed only the most gifted succeeded in doing so.

11. For the future, therefore, hindrances and delays of this sort must be set aside, and we must make straight for our goal, neglecting everything that is not of immediate service. As the proverb says: "Where small means suffice, great should not be used."
12. Let us choose the sun for imitation, since it affords a striking example of the operations of nature. Its functions are laborious and almost unlimited (namely, to send forth its rays over the whole world and to supply all the elements, minerals, plants, and animals, of which countless species exist, with light, warmth, life, and strength), but it proves equal to them all, and every year fulfils the circle of its duties in the most admirable manner.

13. We will therefore examine its various principles of action, with reference to the above-mentioned desiderata of school management.

(i.) The sun does not occupy itself with any single object, animal, or tree; but lights and warms the whole earth at once.

(ii.) It gives light to all things with the same rays; covers all things with moisture by the same processes of evaporation and condensation; it causes the same wind to blow on all things; it puts all things in motion by the same warmth and cold.

(iii.) It causes spring, summer, autumn, and winter to make their appearance in all lands at the same time. At the same time, through its agency, the trees grow green, blossom, and bear fruit (though naturally some do so earlier than others).

(iv.) It always preserves the same order; one day resembles another, one year resembles the next. It always operates on one object by the same method.

(v.) It produces everything from its elementary form, and from no other source.

(vi.) It produces in combination everything that ought to be combined; wood with its bark and its core, a flower with its leaves, a fruit with its skin and its stalk.

(vii.) It causes everything to develop through definite stages, so that one stage prepares the way for the next, and each stage follows naturally from the previous one.

(viii.) Finally, it brings into existence nothing that is useless, or destroys such an object if it be accidentally produced.
14. In imitation of this

(i.) There should only be one teacher in each school, or at any rate in each class.

(ii.) Only one author should be used for each subject studied.

(iii.) The same exercise should be given to the whole class.

(iv.) All subjects and languages should be taught by the same method.

(v.) Everything should be taught thoroughly, briefly, and pithily, that the understanding may be, as it were, unlocked by one key, and may then unravel fresh difficulties of its own accord.

(vi.) All things that are naturally connected ought to be taught in combination.

(vii.) Every subject should be taught in definitely graded steps, that the work of one day may thus expand that of the previous day, and lead up to that of the morrow.

(viii.) And finally, everything that is useless should be invariably discarded.

15. If these reforms could be introduced into schools, there is no doubt that the whole circle of the sciences might be completed with an ease that surpasses our expectation, just as the sun completes its circling course through the heavens every year.

Let us therefore get to work and see if these counsels can be carried into effect, and how the difficulties that hinder their realisation can be overcome.

**First Problem**

*How can a single teacher teach a number of boys, no matter how great, at one time?*

16. I maintain that it is not only possible for one teacher to teach several hundred scholars at once, but that it is also essential; since for both the teachers and their pupils it is by far the most advantageous system. The
larger the number of pupils that he sees before him the greater the interest the teacher will take in his work (just as the hands of a miner tremble with excitement when he discovers a rich vein of ore); and the keener the teacher himself, the greater the enthusiasm that his pupils will display. To the scholars, in the same way, the presence of a number of companions will be productive not only of utility but also of enjoyment (for it gives pleasure to all to have companions in their labours); since they will mutually stimulate and assist one another. Indeed for boys of this age emulation is by far the best stimulus. Again, if a teacher's class be small, this point or that may escape the ears of all his pupils. But if many hear him at once, each one grasps as much as he can, and then, when the lesson is repeated, all comes back into their minds again, since one mind has an invigorating effect on another and one memory on another. In short, as a baker makes a large quantity of bread by a single kneading of the dough and a single heating of the oven, as a brick-maker burns many bricks at one time, as a printer prints hundreds of thousands of books from the same set of type, so should a teacher be able to teach a very large number of pupils at once and without the slightest inconvenience. Do we not see that one trunk can support innumerable branches and supply them with sap, and that the sun is able to vivify the whole earth?

17. How is this to be done? Let us take our former examples, and watch the processes of nature. The trunk does not extend to the outermost branches, but remaining in its place supplies sap to the large ones that are in immediate connection with it, these pass it on to others, and these again in their turn to others, and so on until the smallest twigs have been reached. In the same way the sun does not illumine each individual tree, plant, or animal, but, sending forth its rays from on high, lights up half the world at once, and thus supplies each creature with light and warmth for its own use. We should here notice that the sun's action may be assisted by the lie of
the ground. Valleys and depressions, for instance, collect the rays and thus attain a higher degree of warmth.

18. If matters be arranged in the following manner, one teacher will easily be able to cope with a very large number of scholars. That is to say

(i.) If he divide the whole body into classes, groups of ten, for example, each of which should be controlled by a scholar who is, in his turn, controlled by one of higher rank, and so on.

(ii.) If he never give individual instruction, either privately out of school or publicly in school, but teach all the pupils at one and the same time. He should, therefore, never step up to any one scholar or allow any one of them to come to him separately, but should remain in his seat, where he can be seen and heard by all, just as the sun sends forth its rays over all things. The scholars, on the other hand, must direct their ears, eyes, and thoughts towards him and attend to everything that he tells them by word of mouth or explains by means of his hand or of diagrams. Thus, with a single blow, not one but many flies are killed.

19. (iii.) With a little skill it will be possible to arrest the attention of the pupils, collectively and individually, and to imbue them with the notion that (as really is the case) the mouth of the teacher is a spring from which streams of knowledge issue and flow over them, and that, whenever they see this spring open, they should place their attention, like a cistern, beneath it, and thus allow nothing that flows forth to escape. The teacher also should take the greatest care never to speak unless all his pupils are listening, nor to teach unless they are all attending. In this connection that remark of Seneca's is very apposite: "We should speak to none who is unwilling to listen." Solomon also says: "Wisdom is before the face of him that hath understanding" (Prov. xvii. 24). That is to say, we should talk not to the winds but to the ears of men.

20. It is not solely by means of the leaders or of the
other boys in charge, that attention can be awakened and retained. The teacher is himself the most important factor, and will succeed in his efforts if he observe eight rules.

(i.) If, when he teaches, he take the trouble continually to introduce something that is entertaining as well as of practical use; for in this way the interest of the scholars will be excited and their attention will be arrested.

(ii.) If, at the commencement of any new subject, he excite the interest of his pupils, either by placing it before them in an attractive manner or by asking them questions. These latter may either refer to what has preceded, and thus illustrate the connection between it and the subject in question, or to the new branch of study. For, if the scholar's ignorance of the subject be mercilessly exposed, he may be fired with a desire to master it and understand it thoroughly.

(iii.) If he stand on an elevated platform, and, keeping all the scholars in his sight at once, allow none of them to do anything but attend and look at him.

(iv.) If he aid their attention by appealing to the senses, especially to that of sight, whenever it is possible (as we have shown above, chap. xvii., in the third rule of the eighth Principle).

(v.) If he occasionally interrupt his explanation with the words: Tell me (mentioning some boy), what have I just said? Repeat that sentence! Tell me; how have I reached this point? and remarks of a similar kind, the exact nature of which must depend on the class that he is teaching. If any pupil be found who is not paying attention, he should be reprimanded or punished on the spot. In this way the scholars will be made keen and attentive.

(vi.) Similarly, if he ask one boy, and he hesitate, he should pass on to a second, a third, a tenth, or a thirtieth, and ask for the answer without repeating the question. The result of this will be that all listen carefully to what
is said to one of their number, and apply it to their own use.

(vii.) If some of the boys cannot answer a question he should ask the whole class, and then, in the presence of the rest, praise those who answer best, that their example may serve to stimulate the others. If any pupil make a mistake he should be corrected, but at the same time the cause of the error (which a clever teacher will have no difficulty in discovering) should be made clear and the necessity for its recurrence obviated. It can scarcely be realised what an assistance to rapid progress this will be.

(viii.) Finally, when the lesson is over, the scholars should be given leave to ask questions on any point that they wish explained, either in the present lesson or in a previous one. Private questioning should not be permitted. Each scholar who wishes to ask a question should either ask the teacher openly or get the leader of his division to do so (if this latter is unable to solve the difficulty himself). In this way the whole class will be benefited, and as much by the question as by the answer. If any scholar help to illustrate an important point by the intelligence of his questions, he should be commended, in order that the rest may thereby be incited to industry and keenness.

21. Such a daily training of the attention will not only be of momentary use to the young, but will stand them in good stead throughout their whole lives. For if this training last for some years, and they get into the habit of concentrating their minds on whatever is being done at the time, they will continue to do so of their own accord without any external pressure. If schools are organised on this principle, surely we may look forward to a considerable increase in the number of clever and intelligent men!

22. To this it may be objected that individual attention is necessary to see that each scholar keeps his books tidy, writes his exercises carefully, and learns his lessons accurately, and that, if the class be large, this will take a
great deal of time. I answer: It is not necessary for the teacher to hear the lessons or inspect the books of each individual scholar; since he has the leaders of divisions to assist him, and each of these can inspect the scholars in his own division.

23. The teacher, as chief inspector, should give his attention first to one scholar, then to another, more particularly with the view of testing the honesty of those whom he distrusts. For example, if the scholars have to say a repetition lesson, he should call first on one pupil, then on another, first one at the top of the class and then one at the bottom, while all the rest attend. He may thus ensure that each one be in readiness, since none can be certain that he will not be examined. If the teacher observe that a scholar begins his lessons without hesitation, and feel convinced that he knows the rest equally well, he may let another one go on, and if this one in turn seem well prepared, may pass on to a third. In this way, by hearing a few, he can rest assured that he has the whole class under his control.

24. The same method should be pursued with dictations. One or more scholars should read out what has been written, with the right punctuation and in a clear voice, while the rest correct what they have written in their books. The teacher should also himself examine the books from time to time, and should punish any scholar who has been doing his work carelessly.

25. The correction of written translations seems to demand more time; but here also the same method may be adopted with advantage. As soon as the leaders of divisions have secured attention, one scholar should be called upon to stand up and choose as his adversary any other scholar that he pleases. As soon as this latter stands up, the first scholar reads out his translation sentence by sentence, while all the rest listen attentively, the teacher in the meantime looking at the exercise to see that it is properly written. At the end of each sentence the scholar stops, and his adversary has the opportunity of
pointing out any mistake that he may have perceived. Then other scholars in the division, and after them the whole class, may make criticisms on the rendering, and finally the teacher supplies any point that has been omitted. While this is going on, the others correct the mistakes in their own exercises. The adversary, however, should not do so, but should keep his own unaltered that he may submit it to the criticism of his companions. As soon as the first sentence has been properly corrected, the next is taken, and so on until the exercise is finished. Then the adversary should read out his in the same way, while the original challenger takes care that he really reads his original translation and does not insert the corrections that have been made. The individual words and phrases are then criticised as before.

After this, a second pair of adversaries is chosen, and the same procedure is repeated for as long as the time permits.

26. In this connection the leaders have two duties to perform. Before the corrections begin they should see that all the scholars have their exercises ready, and while it is going on they should take care that each of them corrects his exercise when it contains the mistake that is under consideration.

27. The result of this will be
(i.) That the work of the teacher will be lightened.
(ii.) That no scholar will be neglected.
(iii.) That the scholars will attend better than formerly.
(iv.) That what is said to one will be of equal advantage to all.
(v.) The differences in the mode of expression, that are certain to occur in so many different translations, will not only improve and strengthen the scholar's acquaintance with the subject-matter, but will also give him facility in using the language.

(vi.) Finally, as soon as the first, second, and third pair have finished, it will frequently happen that the others have few or no mistakes left to correct. When
this is the case, the remainder of the time may be devoted to the class in general, that those who are still uncertain about a passage may bring forward their difficulties, or those who think that their rendering is better than that which has been given may read it and receive criticism on it.

28. The method here suggested has been illustrated by an exercise in translation. Its application, however, is just as easy, if the exercise be one in style, rhetoric, logic, theology, or philosophy.

29. We have thus seen that one teacher can instruct a hundred scholars with as little labour as he would expend in teaching a few.

Second Problem

How is it possible for all the scholars to be taught from the same books?

30. It is an undisputed fact that too many objects at once distract the attention. It will therefore be of immense advantage if the scholars be allowed to use no books but those that have been expressly composed for the class in which they are; and in this way it will always be possible to use with effect the order that was given to the worshippers in the temples of old, namely, “This shalt thou do.” Since the less the eyes are distracted, the easier it is to concentrate the mind.

31. Secondly, if all the materials that are required for instruction, blackboards, inscriptions, first reading books, dictionaries, schematic diagrams of the arts, etc., be kept in constant readiness. For if (as is often the case) the teacher must prepare the exercise-books for the scholars, and write a model for them to copy, or if he have to dictate grammatical rules, the text of an author, or its translation, how much time is thereby lost! It is therefore necessary that sufficient quantities of all the books which are used in each class be kept in readiness, and that translations be supplied with those texts that are to be translated into the mother-tongue. In this way the time
that would otherwise have been employed in dictation, copying, and translating, can be used, and with far greater advantage, for explanation, repetition, and imitation.

32. There need be no fear that any concession is here being made to the teacher's idleness. For a preacher is considered to have done his duty if he read a text from the Bible, explain it, and point out its application, and it is a matter of indifference to his hearers whether he has himself translated the text from the original, or has used some standard translation; and in the same way it makes no difference to the scholars whether the teacher has arranged his own materials or whether some one else has done so for him. The important thing is that everything necessary be ready to hand, and that, under the teacher's direction, it be properly employed. It is indeed much better that everything of this nature be prepared beforehand, since, on the one hand, it will be freer from errors, and, on the other, more time will be left for the actual process of instruction.

33. For every school, therefore, books of this kind should be written,—in accordance with the rules already laid down for the attainment of ease, thoroughness, and economy of time,—and should constitute a complete, thorough, and accurate epitome of all the subjects of instruction. In short, they should give a true representation of the entire universe, which can thus be impressed upon the minds of the scholars. They should also, and this is a most important point, be written simply and clearly, and should give the scholars sufficient assistance to enable them, if necessary, to pursue their studies without the help of a teacher.

34. With this end in view it is desirable that they be written in the form of a dialogue. In this way (1) it is possible to suit the subject-matter and its exposition to the minds of the young, that neither may appear to them to be too full of difficulties. Nothing is more suited to inspire confidence than dialogue-form, and by means of it the mind can be gradually led on to the desired goal. It
is in this form that playwrights have expressed their views on the deterioration of morals, and have thereby admonished the people; in this form Plato wrote all his philosophical, and St. Augustine all his theological works, and Cicero also has employed it largely, thus coming down to the level of his readers. (2) Conversational form excites and retains the attention, while the alternation between question and answer, the various forms of expression and the amusing remarks that may be introduced, and even the changes that may be rung upon the *dramatis personæ*, all tend, not merely to counteract any antipathy to the subject, but even to create a keen desire for further knowledge. (3) Instruction makes a far greater impression when given in this way. We remember an event better when we have seen it ourselves than when we have simply heard it narrated, and, in the same way, instruction that is given through the medium of a drama or of a dialogue stays in the heads of the scholars far better than if it be merely set forth by a teacher in the ordinary way, as may be proved by experience. (4) The greater part of our lives consists of friendly conversation, and it should therefore be easy to induce the young to acquire useful information, when they are at the same time learning to express themselves fluently and well. (5) Finally, dialogues of this kind act as a mild recreation, and may enliven the private gatherings of the students.

35. It is also desirable that the books used be of the same edition, so that they may be similar page for page and line for line. This is important both for the sake of reference and that the localisation of passages on certain pages may assist the memory.

36. It will also be of great use if an abstract of the contents of all the books used in the class be placed on the walls of the room. This should consist of the text, greatly abbreviated and condensed, or of illustrative pictures and reliefs, by means of which the senses, the memory, and the understanding may be daily exercised in conjunction. Not without purpose was it that, as the ancients
relate, the walls of the temple of Aesculapius were covered with the precepts of the art of medicine, written there by Hippocrates himself. This great theatre of the world, also, God has filled with pictures, statues, and living emblems of His wisdom, that He may instruct us by their means. (Of these pictorial aids we will say more when we treat of the individual classes.)

**Third Problem**

_How is it possible for all the scholars in a school to do the same thing at one time?_

37. It is evident that it would be a useful arrangement if all the pupils in a class did the same lesson at one time, for in this way the teacher would have less trouble and the scholars greater advantage. It is only when the attention of all is fixed on the same object, and when each tries in turn to correct the other, that keen rivalry can arise. In every way the teacher must imitate a captain of recruits. This latter does not exercise each of his men separately, but leads out a whole company at once and shows them how to use their arms; and even if he explain anything to one man apart, the remainder have to go through the same exercise in order that their attention may be retained.

The teacher should proceed on precisely similar lines.

38. Before he can do this it is necessary

(i.) That the course of instruction commence at one definite time in each year, just as the influence of the sun on the vegetable world commences at one definite time, namely, in spring.

(ii.) That the subjects of instruction be so divided that each year, each month, each week, each day, and even each hour may have a definite task appointed for it, since, if this be done, everything that is proposed will be completed with ease. But of this we will say more in the proper place.
CONCISENESS AND RAPIDITY IN TEACHING

FOURTH PROBLEM

How is it possible to teach everything according to one and the same method?

39. That there is only one natural method for all the sciences, and only one for all the arts and languages, will be shown in chaps. xx., xxx., and xxxi. Any deviations that may be necessary are not important enough to constitute a fresh class, and are due less to peculiarities in the subject-matter than to the teacher himself, who must be guided by the ability, or the reverse, of his pupils and by the progress that they make in the actual languages or arts that he is teaching. The universal adoption of the natural method, therefore, will be as great a boon to scholars as a plain and undeviating road is to travellers. It will be easier to point out special aberrations, if the universal principle be first laid down as indisputable.

FIFTH PROBLEM

How can many things be explained in a few words?

40. To fill the minds of scholars with a dreary waste of books and of words is lost labour. For it is certain that a crust of bread and a mouthful of wine are more nutritious than a paunchful of trifle and of ragout, and that it is better to have a few gold pieces in one's purse than a hundred-weight of lead. Rightly does Seneca say of instruction: "Its administration should resemble the sowing of seed, in which stress is laid, not on quantity, but on quality." The conclusion, therefore, that we reached in chap. v. holds good: In man, the microcosm, everything is contained potentially. Bring light and he will straightway see.

And indeed for men who are working in the dark the faintest glimmer of light is sufficient. It is therefore necessary to select or to write handbooks of the sciences and languages which are small in compass and practically
arranged—cover the whole subject and contain a great deal of matter in a short space (Ecclesiasticus xxxii. 8)—that is to say, which place before the scholar the whole of the subject-matter by means of a small number of rules and definitions expressed in the simplest and clearest language, and sufficient in themselves to lead to more profound study.

_Sixth Problem_

_How is it possible to do two or three things by a single operation?_

41. The example of nature shows that several things can be done at one time and by means of the same operation. It is an undoubted fact that a tree grows above the ground and beneath it at the same time, and that its wood, its bark, its leaves, and its fruit, all develop simultaneously. The same observation applies to animals, whose limbs all develop and grow stronger at the same time. Further, each limb performs several operations. The feet, for instance, not only support a man but also move him forwards and backwards in various ways. The mouth is not only the entrance to the body, but also serves as a masticator and as a trumpet that sounds whenever called upon to do so. With a single inspiration the lungs cool the heart, purify the brain, and assist in voice-production.

42. We find the same thing in the arts: (1) In the sun-dial, the single shadow cast by the gnomon points out the hour of the day, the sign of the zodiac in which the sun is moving, the length of the day and of the night, the day of the month, and several other things. (2) One pole serves to direct, to turn, and to hold back a carriage. (3) A good orator or writer instructs, excites, and pleases at the same time, even though his subject may make it difficult to combine these three elements.

43. The instruction of the young should be similarly organised, so that every activity may produce several
results. It may be laid down as a general rule that each subject should be taught in combination with those which are correlative to it; that is to say, words should be studied in combination with the things to which they refer; while reading and writing, exercises in style and in logical thought, teaching and learning, amusement and serious study, should be continually joined together.

44. Words, therefore, should always be taught and learned in combination with things, just as wine is bought and sold together with the cask that contains it, a dagger with its sheath, a tree with its bark, and fruit with its skin. For what are words but the husks and coverings of things? Therefore, when instruction is given in any language, even in the mother-tongue itself, the words must be explained by reference to the objects that they denote; and contrariwise, the scholars must be taught to express in language whatever they see, hear, handle, or taste, so that their command of language, as it progresses, may ever run parallel to the growth of the understanding.

The rule shall therefore run as follows:

The scholar should be trained to express everything that he sees in words, and should be taught the meaning of all the words that he uses. No one should be allowed to talk about anything that he does not understand, or to understand anything without at the same time being able to express his knowledge in words. For he who cannot express the thoughts of his mind resembles a statue, and he who chatters, without understanding what he says, resembles a parrot.

But we wish to train up men, and to do so as quickly as possible, and this end can only be attained when instruction in language goes hand in hand with instruction in facts.

45. From this it follows that we ought to exclude from our schools all books that merely teach words and do not at the same time lead to a knowledge of useful objects. We must bestow our labour on that which is of real importance, and, therefore (as Seneca says in his 9th
Letter), must devote ourselves to the improvement of our understanding rather than to the enlargement of our vocabulary. Any reading that is necessary can be got through quickly out of school-hours without tedious explanations or attempts at imitation; since the time thus spent could be better employed in the study of nature.

46. Exercises in reading and writing should always be combined. Even when scholars are learning their alphabet, they should be made to master the letters by writing them; since it is impossible to find a more agreeable method or one that will give them a greater incentive to work. For, since all children have a natural desire to draw, this exercise will give them pleasure, and the imagination will be excited by the twofold action of the senses. Later on, when they can read with ease, they should be made to exercise their powers on subject-matter that would in any case have to be learned, that is to say, something calculated to give them practical information or to instil morality or piety. The same plan may be adopted when they learn to read Latin, Greek, or Hebrew. It will be of great advantage to read and copy the declensions and conjugations over and over again, until, by this means, reading, writing, the meaning of the words, and the formation of the case-endings, have been thoroughly learned. In this case we have a fourfold result from a single exercise. A system of concentration that is of such vital importance should be applied to all branches of study, in order that, as Seneca says, what is learned by reading may be given form by writing, or that, as St. Augustine says of himself, we may write while we make progress and make progress while we write.

47. As a rule, no care is shown in the choice of the subjects that are given as exercises in style, and there is no connection between the successive subjects. The result is that they are exercises in style and nothing else, and have very little influence on the reasoning powers; indeed it frequently happens that, after much time and study have been devoted to them, they prove absolutely
worthless and of no use for the business of life. Literary taste should therefore be taught by means of the subject-matter of the science or art on which the reasoning powers of the class are being exercised. The teacher should tell his pupils stories about the originators of the subject and the times in which they lived, or should give them exercises in imitation based on the subject-matter, so that, by a single effort, notions of style may be imbibed, the reasoning powers may be improved, and, since either the teacher or the pupils are continually talking, the faculty of speech also may be exercised.

48. Towards the end of the 18th chapter I have shown that it is possible for the scholars to give instruction in the subject that they have just learned, and, since this process not only makes them thorough but also enables them to make progress more rapidly, it should not be overlooked in this connection.

49. Finally, it will be of immense use, if the amusements that are provided to relax the strain on the minds of the scholars be of such a kind as to lay stress on the more serious side of life, in order that a definite impression may be made on them even in their hours of recreation. For instance, they may be given tools, and allowed to imitate the different handicrafts, by playing at farming, at politics, at being soldiers or architects, etc. In spring they may be taken into the garden or into the country, and may be taught the various species of plants, vying with one another to see who can recognise the greater number. In this way they will be introduced to the rudiments of medicine, and not only will it be evident which of them has a natural bent towards that science, but in many the inclination will be created. Further, in order to encourage them, the mock titles of doctor, licentiate, or student of medicine may be given to those who make the greatest progress. The same plan may be adopted in other kinds of recreation. In the game of war the scholars may become field-marshal, generals, captains, or standard-bearers. In that of politics they may be kings, ministers, chancellors, secretaries,
ambassadors, etc., and, on the same principle, consuls, senators, lawyers, or officials; since such pleasantries often lead to serious things. Thus would be fulfilled Luther's wish that the studies of the young at school could be so organised that the scholars might take as much pleasure in them as in playing at ball all day, and thus for the first time would schools be a real prelude to practical life.

**Seventh Problem**

_How are the subjects of study to be progressively graded?_

50. How this can be done, we have seen in the 5th, 6th, 7th and 8th Principles of the 16th chapter, and in the 5th, 6th and 7th Principles of the 18th chapter. The important point is that suitable books should be written for the classical schools, and that these should embody hints to the teacher for their proper use, so that learning, morality, and piety may be led from one stage to another until they reach the highest.

**Eighth Problem**

_Of the removal and avoidance of obstructions._

51. Truly has it been said, that nothing is more useless than to learn and to know much, if such knowledge be of no avail for practical purposes; and again, that not he who knows much is wise, but he who knows what is useful. The task of schools will therefore be rendered easier if the subjects taught be curtailed. This can be done if omission be made

(i.) Of all unnecessary matter.
(ii.) Of all unsuitable matter.
(iii.) Of all minute detail.

52. Anything is unnecessary that is productive neither of piety nor of morality, and that is not essential for the cultivation of the mind. Such are the names of heathen deities, the myths connected with them, and the religious observances of the ancients, as well as the productions of
scurrilous and indecent poets and dramatists. It may occasionally be necessary for the individual to read these things in private, but in the schools, where the foundations of wisdom should be laid, nothing of the kind should be permitted. "What madness it is," says Seneca, "to learn so much trash, when time is so precious." Nothing, therefore, should be learned solely for its value at school, but for its use in life, that the information which a scholar has acquired may not vanish as soon as he leaves school.

53. Knowledge is unsuitable when it is uncongenial to the mind of this or that scholar. For there is as great a difference between the minds of men as exists between the various kinds of plants, of trees, or of animals; one must be treated in one way, and another in another, and the same method cannot be applied to all alike. It is true that there are men of great mental power who can compass every subject; but there are also many who find the greatest difficulty in mastering the rudiments of some things. Some display great ability for abstract science, but have as little aptitude for practical studies as an ass has for playing on the lyre. Others can learn everything but music, while others again are unable to master mathematics, poetry, or logic. What should be done in these cases? If we attempt to counteract a natural disinclination we are fighting against nature, and such effort is useless. For there will be either no result or one totally incommensurate with the energy expended. The teacher is the servant and not the lord of nature; his mission is to cultivate and not to transform, and therefore he should never attempt to force a scholar to study any subject if he see that it is uncongenial to his natural disposition; since it is more than probable that what is lacking in one direction will be compensated for in another. If one branch be cut off a tree, the others become stronger, because more vitality flows into them; and if none of the scholars be forced to study any subject against his will, we shall find no cases in which disgust is produced and the intelligence is blunted. Each one will develope in the direction
of his natural inclinations (in accordance with the Divine will), and will serve God and man in his station in life, whatever that may be.

54. In the same way, if all minute and technical details (such as the species of plants and of animals, the various callings of mechanics, the names of all their tools and so forth) had to be learned, this would be a most wearisome and confusing task. In school-work it is sufficient if the wide classes that exist in nature, with their most important and most essential divisions, be made thoroughly clear. More specialised knowledge can easily be acquired later, as the opportunity arises.

Those who wish to win a speedy victory over the enemy, do not waste time in storming unimportant places, but go straight to the head-quarters of the war; since it is certain that, if they can get the upper hand in a pitched battle, and capture the most important strongholds, all the others will surrender of their own accord. In the same way, if the principal points of any subject be mastered, the subsidiary details will be acquired with great ease. To this class of obstructions belong the voluminous dictionaries that contain every word in a language. For, since the greater number of them are never used, why should we force boys to learn them all, and thus overburden the memory?

We have now treated of the saving of time and effort in teaching and in learning.
CHAPTER XX

THE METHOD OF THE SCIENCES, SPECIFICALLY

1. We must now collect together the scattered observations that we have made on the proper teaching of the sciences, of the arts, of morality, and of piety. By proper teaching I mean teaching that combines ease, thoroughness, and rapidity.

2. Science, or the knowledge of nature, consists of an internal perception, and needs the same accessories as the external perception of the eye, namely, an object to observe, and light by which to observe it. If these be given, perception will follow. The eye of the inner perception is the mind or the understanding, the object is all that lies within or without our apprehension, while the light is the necessary attention. But, as in the case of external perception a definite procedure is necessary in order to apprehend things as they are, so with internal perception a certain method is necessary if things are to be presented to the mind in such a way that it can grasp them and assimilate them with ease.

3. The youth who wishes to penetrate the mysteries of the sciences must carefully observe four rules:

(i.) He must keep the eye of his mind pure.
(ii.) He must see that the object be brought near to it.
(iii.) He must pay attention.
(iv.) He must proceed from one object to another in
accordance with a suitable method. For thus he will apprehend everything surely and easily.

4. Over the amount of ability that we possess we have no control, for God has portioned out this mirror of the understanding, this inner eye, according to His will. But it lies in our power to prevent it from growing dusty or dim. By dust, I mean the idle, useless, and empty occupations of the mind. For our mind is in constant activity, like a continually running mill-stone, and is supplied by its servants, the external senses, with material from every side. But unless the chief inspector, the reason, be continually on the watch, worthless material is supplied, such as chaff, straw, or sand, instead of corn or wheat. Thus it comes to pass that, as in the case of a mill, every corner is filled with dust. This inner mill, therefore, the mind (which is also a mirror) will be kept free from dust, if the young be kept away from worthless occupations and be skilfully trained to like worthy and useful things.

5. In order that the mirror may duly receive the images of the objects, it is necessary that these latter be solid and visible, and be also placed suitably before the eyes. Clouds and similar objects that possess little consistency make but a slight impression on a mirror, while objects that are not present make none at all. Those things, therefore, that are placed before the intelligence of the young, must be real things and not the shadows of things. I repeat, they must be things; and by the term I mean determinate, real, and useful things that can make an impression on the senses and on the imagination. But they can only make this impression when brought sufficiently near.

6. From this a golden rule for teachers may be derived. Everything should, as far as is possible, be placed before the senses. Everything visible should be brought before the organ of sight, everything audible before that of hearing. Odours should be placed before the sense of smell, and things that are tastable and tangible before the sense of taste and of touch respectively. If an object can make
an impression on several senses at once, it should be brought into contact with several, though with the limitations imposed in the seventh Principle of chap. viii.

7. For this there are three cogent reasons. Firstly, the commencement of knowledge must always come from the senses (for the understanding possesses nothing that it has not first derived from the senses). Surely, then, the beginning of wisdom should consist, not in the mere learning the names of things, but in the actual perception of the things themselves! It is when the thing has been grasped by the senses that language should fulfil its function of explaining it still further.

8. Secondly, the truth and certainty of science depend more on the witness of the senses than on anything else. For things impress themselves directly on the senses, but on the understanding only mediately and through the senses. This is evident from the fact that belief is at once accorded to knowledge derived from the senses, while an appeal is always made to them from a priori reasoning and from the testimony of others. We do not trust a conclusion derived from reasoning unless it can be verified by a display of examples (the trustworthiness of which depends on sensuous perception). No one could have such confidence in the testimony of another person as to disbelieve the experience of his own senses. Science, then, increases in certainty in proportion as it depends on sensuous perception. It follows, therefore, that if we wish to implant a true and certain knowledge of things in our pupils, we must take especial care that everything be learned by means of actual observation and sensuous perception.

9. Thirdly, since the senses are the most trusty servants of the memory, this method of sensuous perception, if universally applied, will lead to the permanent retention of knowledge that has once been acquired. For instance, if I have once tasted sugar, seen a camel, heard a nightingale sing, or been in Rome, and have on each occasion attentively impressed the fact on my memory, the incidents will
remain fresh and permanent. We find, accordingly, that children can easily learn Scriptural and secular stories from pictures. Indeed, he who has once seen a rhinoceros (even in a picture) or been present at a certain occurrence, can picture the animal to himself and retain the event in his memory with greater ease than if they had been described to him six hundred times. Hence the saying of Plautus: "An eye-witness is worth more than ten ear-witnesses." Horace also says: "What is entrusted to the fickle ears makes less impression on the mind than things which are actually presented to the eyes and which the spectator stores up for himself."

In the same manner, whoever has once seen a dissection of the human body will understand and remember the relative position of its parts with far greater certainty than if he had read the most exhaustive treatises on anatomy, but had never actually seen a dissection performed. Hence the saying, "Seeing is believing."

10. If the objects themselves cannot be procured, representations of them may be used. Copies or models may be constructed for teaching purposes, and the same principle may be adopted by botanists, geometricians, zoologists, and geographers, who should illustrate their descriptions by engravings of the objects described. The same thing should be done in books on physics and elsewhere. For example, the human body will be well explained by ocular demonstration if the following plan be adopted. A skeleton should be procured (either such an one as is usually kept in universities, or one made of wood), and on this framework should be placed the muscles, sinews, nerves, veins, arteries, as well as the intestines, the lungs, the heart, the diaphragm, and the liver. These should be made of leather and stuffed with wool, and should be of the right size and in the right place, while on each organ should be written its name and its function. If you take the student of medicine to this construction and explain each part to him separately, he will grasp all the details without any effort, and from that time forth will
understand the mechanism of his own body. For every branch of knowledge similar constructions (that is to say, images of things which cannot be procured in the original) should be made, and should be kept in the schools ready for use. It is true that expense and labour will be necessary to produce these models, but the result will amply reward the effort.

11. If any be uncertain if all things can be placed before the senses in this way, even things spiritual and things absent (things in heaven, or in hell, or beyond the sea), let him remember that all things have been harmoniously arranged by God in such a manner that the higher in the scale of existence can be represented by the lower, the absent by the present, and the invisible by the visible. This can be seen in the *Macrocosmico* of Robert Flutt,* in which the origin of the winds, of rain, and of thunder is described in such a way that the reader can visualise it. Nor is there any doubt that even greater concreteness and ease of demonstration than is here displayed might be attained.

12. So much of the presentation of objects to the senses. We must now speak of the light, the absence of which renders the presentation of objects to the eyes useless. This light of the teaching art is attention, and by its means the learner can keep his mind from wandering and can take in everything that is put before him. It is impossible for any man to see an object in the dark, or if his eyes be closed, no matter how near to him it may be; and in the same way, if you talk to one who is not attending, or show him anything, you will make no impression on his senses. This we can observe in the case of those who, while lost in thought, do not notice what is going on before their eyes. He, therefore, who wishes to show anything to another at night must provide light, and must polish the object so that it shines; and in the same way a master, if he wish to illumine with knowledge a pupil shrouded in the darkness of ignorance, must first excite his attention, that he may drink in information with a greedy mind.
THE GREAT DIDACTIC

How this can be done we have shown in the 17th chapter, and in the first Principle of the 19th chapter.

13. So much of the light. We will now speak of the mode in which objects must be presented to the senses, if the impression is to be distinct. This can be readily understood if we consider the processes of actual vision. If the object is to be clearly seen it is necessary: (1) that it be placed before the eyes; (2) not far off, but at a reasonable distance; (3) not on one side, but straight before the eyes; (4) and so that the front of the object be not turned away from, but directed towards, the observer; (5) that the eyes first take in the object as a whole; (6) and then proceed to distinguish the parts; (7) inspecting these in order from the beginning to the end; (8) that attention be paid to each and every part; (9) until they are all grasped by means of their essential attributes. If these requisites be properly observed, vision takes place successfully; but if one be neglected its success is only partial.

14. For instance, if any one wish to read a letter that has been sent him by a friend, it is necessary: (1) that it be presented to the eyes (for if it be not seen, how can it be read?); (2) that it be placed at a suitable distance from the eyes (for if it be too far off, the words cannot be distinguished); (3) that it be directly in front of the eyes (for if it be on one side, it will be confusedly seen); (4) that it be turned the right way up (for if a letter or a book be presented to the eyes upside down or on its side, it cannot be read); (5) the general characteristics of the letter, such as the address, the writer, and the date must be seen first (for unless these facts be known, the particular items of the letter cannot be properly understood); (6) then the remainder of the letter must be read, that nothing be omitted (otherwise the contents will not all be known, and perhaps the most important point will be missed); (7) it must be read in the right order (if one sentence be read here and another there, the sense will be confused); (8) each sentence must be mastered before the next is com-
mented (for if the whole be read hurriedly, some useful point may easily escape the mind); (9) finally, when the whole has been carefully perused, the reader may proceed to distinguish between those points that are necessary and those that are superfluous.

15. These points should be observed by those who teach the sciences, and may be expressed in nine very useful precepts.

(i.) Whatever is to be known must be taught.

Unless that which is to be known be placed before a pupil, how is he to acquire a knowledge of it? Therefore let those who teach beware of concealing anything from their pupils, whether of intent, as do the envious and dishonest, or through carelessness, as is the case with those who perform their duties in a perfunctory manner. The two things necessary are honesty and hard work.

16. (ii.) Whatever is taught should be taught as being of practical application in every-day life and of some definite use.

That is to say, the pupil should understand that what he learns is not taken out of some Utopia or borrowed from Plutonic Ideas, but is one of the facts which surround us, and that a fitting acquaintance with it will be of great service in life. In this way his energy and his accuracy will be increased.

17. (iii.) Whatever is taught should be taught straightforwardly, and not in a complicated manner.

This means that we must look straight at objects and not squint, for in that case the eyes do not see that at which they look, but rather distort and confuse it. Objects should be placed before the eyes of the student in their true character, and not shrouded in words, metaphors, or hyperboles. These devices have their use if the object be to exaggerate or to detract from, to praise or to blame what is already known. But when knowledge is being acquired they should be avoided and the facts should be set forth plainly.

18. (iv.) Whatever is taught must be taught with reference
to its true nature and its origin; that is to say, through its causes.

This method of cognition is the best if the true nature of a fact is to be learned. For if its true nature be not made evident, this is not cognition but error. The true nature of a fact lies in the process that brought it into being. If it appear to contain elements not accounted for by that process, it is evident that there is some misapprehension. Now everything is brought into existence by its causes. Therefore to explain the causes of anything is equivalent to making a true exposition of that thing's nature, in accordance with the principles: "Knowledge consists in having a firm grip of causes," and "Causes are the guides of the understanding." Objects can thus be best, easiest, and most certainly cognised through a knowledge of the processes that produced them. If a man wish to read a letter he holds it as it was written, since it is a difficult thing to read a document that is inverted, or on its side, and in the same way, if a fact be explained by means of the process that gave it birth, it will be easily and surely understood. If, however, the teacher reverse the order of nature, he is certain to confuse the student. Therefore, the method employed in teaching should be based on the method of nature. That which precedes should be taken first, and that which follows last.

19. (v.) If anything is to be learned, its general principles must first be explained. Its details may then be considered, and not till then.

The reasons for this have been given in chap. xvi. Principle 6. We give a general notion of an object when we explain it by means of its essential nature and its accidental qualities. The essential nature is unfolded by the questions what? of what kind? and why? Under the question what? are included the name, the genus, the function, and the end. Under the question of what kind? comes the form of the object, or the mode in which it is fitted to its end. Under the question why? the efficient or causal force by which an object is made suitable to its
For example, did I wish to give a student a general notion of a man, I should say: Man is (1) the chief creation of God, and destined for dominion over other creatures; (2) endowed with freedom of choice and action; (3) and on that account provided with the light of reason, that he may direct his choice and his actions with wisdom. This is but a general notion of man, but it goes to the root of the matter and says everything about him that is essential. To these you may, if you like, add some of his accidental qualities, still keeping to generalities, and this must be done by asking the questions: from what origin? whence? when? You may then proceed to his parts, the body and the soul. The nature of the body can be demonstrated through the anatomy of its organs; that of the soul by examining the faculties of which it consists. All these points must be taken in their proper order.

20. (vi.) All the parts of an object, even the smallest, and without a single exception, must be learned with reference to their order, their position, and their connection with one another.

Nothing exists in vain, and sometimes the strength of the larger parts depends on that of the smallest. Certain it is that in a clock, if one pin be broken or bent, or moved out of its place, the whole machine will stop. Similarly, in a living body, the loss of one organ may cause life to cease, and in a sentence it is often on the smallest words, such as prepositions and conjunctions, that the whole sense depends. Perfect knowledge of an object can therefore only be attained by acquiring a knowledge of the nature and function of each of its parts.

21. (vii.) All things must be taught in due succession, and not more than one thing should be taught at one time.

The organ of vision is unable to take in two or three objects at one time (certain it is that he who reads a book cannot look at two pages at once, nay, cannot even see two lines, though they lie quite close together, nor two words, nor two letters, otherwise than successively); and in the
same way the mind can only grasp one thing at a time. We should therefore make a distinct break in our progress from one thing to another, that we may not overburden the mind.

22. (viii.) We should not leave any subject until it is thoroughly understood.

Nothing can be done in a moment. For every process involves motion, and motion implies successive stages. The pupil should therefore not pass on from any point in a science until he has thoroughly mastered it and is conscious that he has done so. The methods to be employed are emphatic teaching, examination, and iteration, until the desired result is attained. This we have pointed out in chap. xviii. Principle 10.

23. (ix.) Stress should be laid on the differences which exist between things, in order that what knowledge of them is acquired may be clear and distinct.

Much meaning lies concealed in that celebrated saying: "He who distinguishes well is a good teacher." For too many facts overwhelm a student, and too great a variety confuses him. Remedies must therefore be applied: in the first case order, by means of which one thing may be taken after another; in the second, a careful consideration of the differences that exist in nature, that it may always be evident in what respects one thing differs from another. This is the only method that can give distinct, clear, and certain knowledge; since the variety and actuality of natural objects depend on their distinctive attributes, as we have hinted in chap. xviii. Principle 6.

24. Now it is impossible that all teachers, when they enter on their profession, should be possessed of the requisite skill, and it is therefore necessary that the sciences which are taught in schools be mapped out in accordance with the foregoing laws. If this be done it will be difficult for any teacher to miss his mark. For, if the laws be rigorously observed, it is beyond question that any man who is once admitted into the royal palace and is allotted a certain space of time can easily and without any trouble
master its whole contents, its pictures, statues, carpets, and other ornaments; and just as easy will it be for a youth who is admitted to the theatre of this world to penetrate with his mental vision the secrets of nature, and from that time forward to move among the works of God and of man with his eyes opened.
CHAPTER XXI

THE METHOD OF THE ARTS

1. "Theory," says Vives, "is easy and short, but has no result other than the gratification that it affords. Practice, on the other hand, is difficult and prolix, but is of immense utility." Since this is so, we should diligently seek out a method by which the young may be easily led to the practical application of natural forces, which is to be found in the arts.

2. Art primarily requires three things: (1) A model or a conception; that is to say, an external form which the artist may examine and then try to imitate. (2) The material on which the new form is to be impressed. (3) The instruments by the aid of which the work is accomplished.

3. But when the instruments, the materials, and the model have been provided, three more things are necessary before we can learn an art: (1) a proper use of the materials; (2) skilled guidance; (3) frequent practice. That is to say, the pupil should be taught when and how to use his materials; he should be given assistance when using them that he may not make mistakes, or that he may be corrected if he do; and he should not leave off making mistakes and being corrected until he can work correctly and quickly.

4. With respect to these points eleven canons must be observed: six on the use of materials; three on guidance; and two on practice.

5. (i.) What has to be done must be learned by practice.
Artisans do not detain their apprentices with theories, but set them to do practical work at an early stage; thus they learn to forge by forging, to carve by carving, to paint by painting, and to dance by dancing. In schools, therefore, let the students learn to write by writing, to talk by talking, to sing by singing, and to reason by reasoning. In this way schools will become workshops humming with work, and students whose efforts prove successful will experience the truth of the proverb: "We give form to ourselves and to our materials at the same time."

6. (ii.) A definite model of that which has to be made must always be provided.

This the student should first examine, and then imitate, as though he were following in the footsteps of a guide. For he who neither knows what has to be done nor how to do it, is unable to produce anything of himself, but must have a model placed before him. Indeed it is sheer cruelty to force any one to do what you wish, while he is ignorant what your wishes are; to demand, that is to say, that he form straight lines, right angles, or perfect circles, unless you first give him a ruler, a square, and a pair of compasses, and explain their use to him. Further, great care should be taken to provide in the school-room formulae for or models of everything that has to be made, and these, whether drawings and diagrams, or rules and models, should be correct, definite, and simple; easy both to understand and to imitate. There will then be no absurdity in demanding of a man that he see, when provided with a light; that he walk, when he already stands on his feet; or that he use the tools that are already in his hands.

7. (iii.) The use of instruments should be shown in practice and not by words; that is to say, by example rather than by precept.

It is many years since Quintilian said: "Through precepts the way is long and difficult, while through examples it is short and practicable." But alas, how little heed the ordinary schools pay to this advice. The very
beginners in grammar are so overwhelmed by precepts, rules, exceptions to the rules, and exceptions to the exceptions, that for the most part they do not know what they are doing, and are quite stupefied before they begin to understand anything. Mechanics do not begin by drumming rules into their apprentices. They take them into the workshop and bid them look at the work that has been produced, and then, when they wish to imitate this (for man is an imitative animal), they place tools in their hands and show them how they should be held and used. Then, if they make mistakes, they give them advice and correct them, often more by example than by mere words, and, as the facts show, the novices easily succeed in their imitation. For there is great truth in that saying of the Germans, "A good leader finds a good follower." Very apposite, too, is the remark of Terence, "Do you go before; I will follow." This is the way, namely, by imitating, and without any laborious rules, that children learn to walk, to run, to talk, and to play. Rules are like thorns to the understanding, and to grasp their meaning needs both attention and ability, while even the dullest students are aided by example. No one has ever mastered any language or art by precept alone; while by practice this is possible, even without precept.

8. (iv.) Practice should commence with the rudiments and not with ambitious works.

A carpenter does not begin by teaching his apprentice to build turrets, but first shows him how to hold the axe, to cut down trees, to shape planks, to bore holes, and to fasten beams together. A painter does not make his pupil commence by painting portraits, but teaches him how to mix colours, to hold the brush, and to make lines; then to attempt rough outlines, and so on. He who teaches a boy how to read explains to him, not the contents of the book, but the names and nature of the letters, and shows him how they can be joined together into syllables; then he proceeds to words, and then to sentences. In the same way the beginner in grammar should learn, first how
to inflect single words, then how to join two together. Then he may advance to simple and compound sentences, and so on till he reach continuous prose. So too in dialectic. The student should first learn to distinguish things and the concepts of things by means of their genera and species; then to classify them afresh, with respect to some other common quality (for such links exist between all things); then to define and distribute them; then to estimate the value of the things and their concepts in combination, seeking out the what? the whence? and the why? and whether it be necessary or contingent. When he has had sufficient practice in this, he may proceed to ratiocination and seek how to draw conclusions from given premises, and finally he may essay discursive reasoning or the complete conduct of disputations. The same course may with advantage be followed in rhetoric. The student should first devote some time to the collection of synonyms, and may then learn to add epithets to nouns, verbs, and adverbs. He may then proceed to the use of antithesis, and later on to that of periphrasis. Then he may substitute figurative words for the originals, alter the order of the words for the sake of euphony, and adorn a simple sentence with all the figures of speech. Finally, when thoroughly versed in all these several points, and not sooner, he may proceed to the composition of a complete discourse. If any one advance step by step in any art, as here indicated, it is impossible that he should not make progress.

The basis of the foregoing was discussed in chap. xvii. Principle 4.

9. (v.) Beginners should at first practise on a material that is familiar to them.

This rule we obtain from the 9th Principle of the 17th chapter, and from the 6th Corollary of the 4th Principle. Its meaning is that students should not be overburdened with matters that are unsuitable to their age, comprehension, and present condition, since otherwise they will spend their time in wrestling with shadows. For example, when a Polish boy is learning to read or to write his letters
he should not be taught to do so from a book written in Latin, Greek, or Arabic, but from one written in his own language, that he may understand what he is doing. Again, if a boy is to understand the use of the rules of rhetoric, the examples on which he is made to practise them should not be taken from Virgil or from Cicero, or from theological, political, or medical writers, but should refer to the objects that surround him, to his books, to his clothes, to trees, houses, and schools. It will also be of use if the examples that are taken to illustrate the first rule be retained, although familiar, to illustrate the remainder. In dialectic, for example, a tree may be taken, and its genus, its species, its relations to other objects, its characteristic peculiarities and the logical definition and distribution of the term may be treated of. We may then proceed to the various ways in which a statement may be made about a tree. Finally, we may show how, by a perfect train of reasoning, and by taking the facts already ascertained as our starting-point, we may discover and demonstrate other properties of a tree. In this way, if, in each case, the use of the rules be illustrated by the same familiar example, the boy will easily master their application to all other subjects.

10. (vi.) At first the prescribed form should be imitated with exactness. Later on more freedom may be allowed.

A form will be expressed with more exactness in proportion as care is taken to make it resemble its original. Thus coins that are struck by one die are exactly like the die and one another. So also with books printed from metal type, and with casts made in wax, plaster, or metal. In all other artistic operations, therefore, as far as is possible, any imitation (at any rate the first) should be an exact copy of its original, until the hand, the mind, and the tongue gain more confidence, and can produce good imitations by working freely on their own lines. For instance, those who learn writing take a thin and transparent sheet of paper, place it over the copy that they wish to imitate, and thus can easily form the letters that show through. Or the characters may be printed very faintly on a white page, so
that the pupil may go over them with pen and ink, and in this way may easily acquire the habit of shaping them. The same thing holds good in style, if any construction or sentence extracted from a classic writer have to be imitated. If the original phrase be “Rich in possessions,” the boy should be made to imitate it by saying, “Rich in coins,” “Rich in moneys,” “Rich in flocks,” “Rich in vineyards.” When Cicero says, “In the opinion of the most learned men, Eudemus easily holds the first place in astrology,” this may be copied with very little alteration as “In the opinion of the greatest orators, Cicero easily holds the first place in eloquence.” “In the opinion of the whole Church, St. Paul easily holds the first place in Apostleship.” So too in logic, if the well-known dilemma be given: It is either day or night. But it is night; therefore it is not day; the boy may learn to imitate it by similarly opposing contradictory conceptions to one another. As, “He is either unlearned or learned. But he is unlearned; therefore he is not learned”; “Cain was either pious or impious, but he was not pious”; and so on.

11. (vii.) The models of the objects that have to be produced must be as perfect as is possible, so that if any one exercise himself sufficiently in imitating them it will be possible for him to become perfect in his art.

It is impossible to draw straight lines with a curved ruler, and in the same way a good copy cannot be made from a bad model. Great care should therefore be taken that models be prepared of everything that is to be done in school, or indeed in life, and that these be exact, simple, and easy to imitate. They may be either models, pictures and drawings, or precepts and rules; but all must be very short, very clear, self-evident, and absolutely correct.

12. (viii.) The first attempt at imitation should be as accurate as possible, that not the smallest deviation from the model be made.

That is to say, as far as is possible. For whatever comes first is, as it were, the foundation of that which follows. If the foundation be firm, a solid edifice can be constructed
upon it, but if it be weak this is impossible. According to
the observations of physicians, the initial defects of digestion
cannot be repaired later on, and similarly in any operation
an error at the beginning vitiates all that follows. For this
reason Timotheus the musician used to demand twice as
large a fee from those pupils who had learned the rudiments
of their art elsewhere, saying that his labour was twofold,
as he had first to get them out of the bad habits that they
had acquired, and then to teach them correctly. Those,
therefore, who are learning any art should take care to
make themselves masters of the rudiments by imitating
their copies accurately. This difficulty once overcome,
the rest follows of itself, just as a city lies at the mercy of
foes when its gates are broken in. All haste should be
avoided, lest we proceed to advanced work before the
elementary stages have been mastered. He goes fast
enough who never quits the road, and a delay which is
caused by obtaining a thorough grip of first principles is
really no delay, but an advance towards mastering what
follows with ease, speed, and accuracy.

13. (ix.) Errors must be corrected by the master on the
spot; but precepts, that is to say the rules, and the excep-
tions to the rules, must be given at the same time.

Hitherto we have urged that the arts be taught rather
by example than by precept: we now add that precepts
and rules must be given as well, that they may guide the
operations and prevent error. That is to say, the less
obvious points of the model should be clearly explained,
and it should be made evident how the operation should
begin, what it should aim at, and how that aim can be
realised. Reasons should also be given for each rule. In
this way a thorough knowledge of the art, and confidence
and exactness in imitating, will be attained.

But these rules should be as short and as simple as
possible, since we do not want to grow gray while acquir-
ing them. When once mastered they should be of per-
petual use, even when laid aside, just as knee-bands are of
use to a child who is learning to walk, and, though they
are afterwards discarded, the advantage derived from them remains.

14. (x.) The perfect teaching of art is based on synthesis and analysis.

We have already shown (chap. xviii. Principle 5) by examples taken from nature and the workshop that in this relation synthesis is more important. The following points in addition will show that synthetic exercises should generally come first: (1) We should always commence with what is easy, and our own efforts are easier to understand than those of other people. (2) Writers take pains to conceal the artifices by which their results are obtained, so that at first the student finds difficulty in understanding what he sees, or fails to do so altogether. This difficulty would be removed if he began by practising on his own attempts, which are void of artifice. (3) The chief thing aimed at should be given the chief place in practice, and our real aim is to accustom the student of art to produce original work, and not merely to copy what is placed before him (see chapter xviii. Principle 5).

15. For all this, the accurate analysis of the work of others must not be neglected. It is only by continually traversing it that we get to know a road, its by-paths, and its cross-roads. Besides, the variety that exists in nature is so great that it is impossible for rules to cover it or for one mind to master it. Many processes require many rules to express them, and these we can only learn if we analyse and study, and by imitation and emulation put ourselves in a position to produce similar results.

16. It is our wish then that in each art complete and exact models or examples of everything that can be produced in that art be supplied to the student. Precepts also and rules should be given him to help him to carry out the processes, to guide his efforts at imitation, to show him how to avoid making faults, and to correct them when made. Then other and different models should be given him, and these he should learn to classify and compare with the models that he has already used, and by copying
a model that is like one previously used to produce work that resembles the original. After this, the finished works of other artists (who must be well known) may be examined and analysed in accordance with the models and rules that are already familiar. In this way the student will learn to employ the rules with greater ease, and will acquire the art of concealing his art. Only after a course of exercises of this kind will he be in the position to criticise artistic productions, whether his own or those of others.

17. (xi.) These exercises must be continued until artistic production becomes second nature.

For it is practice, and nothing else, that produces an artist.
CHAPTER XXII

THE METHOD OF LANGUAGES

1. Languages are learned, not as forming in themselves a part of erudition or wisdom, but as being the means by which we may acquire knowledge and may impart it to others.

It follows, therefore, (1) that not all languages should be learned, for this would be impossible; nor many, for this would be useless and would waste time that might be devoted to the acquisition of practical information; but only those that are necessary. Now necessary languages are these: the vernacular, for use at home, and the languages of the adjoining countries, for the sake of holding intercourse with neighbours. Thus for the Poles, German would be necessary; for others, the Hungarian, Wallachian, or Turkish languages. For the reading of serious books Latin is also advisable, as it is the common language of the learned. For philosophers and physicians, Greek and Arabic; and for theologians, Greek and Hebrew.

2. Not all these languages should be learned thoroughly, but only so far as is necessary.

It is not necessary to speak Greek or Hebrew as fluently as the mother-tongue, since there are no people with whom we can converse in those languages. It suffices to learn them well enough to be able to read and understand books written in them.

3. The study of languages, especially in youth, should be joined to that of objects, that our acquaintance with
the objective world and with language, that is to say, our knowledge of facts and our power to express them, may progress side by side. For it is men that we are forming and not parrots, as has been said in chap. xix. Principle 6.

4. From this it follows, firstly, that words should not be learned apart from the objects to which they refer; since the objects do not exist separately and cannot be apprehended without words, but both exist and perform their functions together. It was this consideration that led me to publish the Janua Linguarum; in which words, arranged in sentences, explain the nature of objects, and, as it is said, with no small success.

5. Secondly, that the complete and detailed knowledge of a language, no matter which it be, is quite unnecessary, and that it is absurd and useless on the part of any one to try to attain it. Not even Cicero (who is considered the greatest master of the Latin language) was acquainted with all its details, since he confessed that he was ignorant of the words used by artisans; for he had never mixed with cobbler and labourers, so as to see their handiwork and hear the technical terms that they used. Indeed what object could he have had in learning such terms?

6. Those who have expanded my Janua have paid no attention to this, but have stuffed it with uncommon words and with matter quite unsuited to a boy's comprehension. A Janua should remain a Janua, and anything further should be reserved for a future time. This is especially the case with words which either never occur, or which, if met with, can easily be looked up in subsidiary books (such as vocabularies, lexicons, herbaries, etc.). It was for this reason that I discontinued my Latinitatis Posticum (into which I was introducing obsolete and unusual words).

7. In the third place it follows that the intelligence as well as the language of boys should preferably be exercised on matters which appeal to them, and that what appeals to adults should be left for a later stage. They waste their time who place before boys Cicero and other great writers.
For, if students do not understand the subject-matter, how can they master the various devices for expressing it forcibly? The time is more usefully spent on less ambitious efforts, so devised that the knowledge of the language and the general intelligence may advance together and step by step. Nature makes no leap, and neither does art, since it imitates nature. We must teach boys to walk before we give them lessons in dancing; to ride on a hobby-horse before we set them on a charger; to prattle before they speak, and to speak before they deliver orations. It was Cicero who said that he could teach no one to deliver orations who had not first learned how to talk.

8. As regards the plurality of tongues, our method, which we will reduce to eight rules, will render the acquisition of the various languages an easy matter.

9. (i.) Each language must be learned separately.

First of all the mother-tongue must be learned, and then the language that may have to be used in its place, I mean that of the neighbouring nation (for I am of opinion that modern languages should be commenced before the learned ones). Then Latin may be learned, and after Latin, Greek, Hebrew, etc.

One language should always be learned after, and not at the same time as, another; since otherwise both will be learned confusedly. It is only when they have been thoroughly acquired that it is of use to compare them by means of parallel grammars, dictionaries, etc.

10. (ii.) Each language must have a definite space of time allotted to it.

We should take care not to convert a subsidiary study into a chief one, or to waste on the acquisition of words the time in which we might gain a knowledge of things. The mother-tongue, since it is intimately connected with the gradual unfolding of the objective world to the senses, necessarily requires several years (I should say eight or ten, or the whole of childhood, with a part of boyhood). We may then proceed to the other modern languages, each of which can be sufficiently mastered in one year. Latin can
be learned in two years, Greek in one year, and Hebrew in six months.

11. (iii.) All languages are easier to learn by practice than from rules.

That is to say, by hearing, reading, re-reading, copying, imitating with hand and tongue, and doing all these as frequently as is possible. Cf. the preceding chapter, canons i. and xi.

12. (iv.) But rules assist and strengthen the knowledge derived from practice.

This we have treated of in the previous chapter, canon ii. We speak more especially of the learned languages which we are compelled to learn from books, though we do not exclude modern languages. For Italian, French, German, Bohemian, and Hungarian can be, and indeed have already been, reduced to rules.

13. (v.) The rules to which languages are reduced should be grammatical and not philosophic.

That is to say, they should not inquire into the causes and antecedents of words, phrases, and sentences, or seek to find out why this or that construction is necessary, but should simply state what is correct and how the constructions should be made. The subtler investigation into the causes and connecting links, the similarities and dissimilarities, the analogies and anomalies that exist in things and in words, is the business of the philosopher, and does but delay the philologist.

14. (vi.) In writing rules for the new language the one already known must be continually kept in mind, so that stress may be laid only on the points in which the languages differ.

To call attention to points that they possess in common is not merely useless, but actually harmful, since the mind is terrified by the semblance of greater prolixity and irregularity than really exist. For instance, in Greek grammar there is no need to repeat the definitions of nouns, verbs, cases, and tenses, or rules of syntax which convey nothing new, and which may be considered as
already familiar. Those only need be included in which the usage of Greek differs from that of Latin, which is already known. In this way Greek grammar may be reduced to a few pages, and will thus be both clearer and easier.

15. (vii.) The first exercises in a new language must deal with subject-matter that is already familiar.

Otherwise the mind will have to pay attention to words and to things at the same time, and will thus be distracted and weakened. Its efforts should therefore be confined to words, that it may master them easily and quickly. Such subject-matter might very well be the Catechism, or Biblical history, or in fact anything that is sufficiently familiar. (Being short, my Vestibulum and Janua might be used; though these are more suitable to commit to memory, while the subjects suggested above are fit for constant reading on account of the constant recurrence of the same words, which will thus grow familiar and impress themselves on the memory.)

16. (viii.) All languages, therefore, can be learned by the method.

That is to say, by practice, combined with rules of a very simple nature that only refer to points of difference with the language already known, and by exercises that refer to some familiar subject.

17. Of the languages that should be learned carefully.

As we said at the commencement of the chapter, all languages need not be learned with equal accuracy. The mother-tongue and Latin are the most worthy of attention, and we should all master them thoroughly. This course of language-study may be divided into four ages—

<table>
<thead>
<tr>
<th>The first age is</th>
<th>babbling infancy</th>
<th>indistinctly correctly</th>
</tr>
</thead>
<tbody>
<tr>
<td>The second age is</td>
<td>ripening boyhood</td>
<td>in which we learn to speak elegantly</td>
</tr>
<tr>
<td>The third</td>
<td>matuer youth</td>
<td></td>
</tr>
<tr>
<td>The fourth</td>
<td>vigorous manhood</td>
<td></td>
</tr>
</tbody>
</table>
18. Gradation of this kind is the only true principle.
On any other system everything falls into confusion and
disorder, as we have most of us experienced. But through
these four grades all who wish to learn languages may pass
with ease if the proper materials for teaching languages
have been provided; that is to say, suitable school-books
for the pupils and hand-books to assist the teacher, both
of which should be short and methodical.

19. The school-books, suited to the several ages, should
be four in number—
(i.) The Vestibulum.
(ii.) The Janua.
(iii.) The Palatium.
(iv.) The Thesaurus.

20. The Vestibulum should contain the materials for a
child's conversation—a few hundred words, arranged in
sentences, to which are added the declensions of nouns
and the conjugations of verbs.

21. The Janua should contain all the common words
in the language, about 8000 in number. These should
be arranged in short sentences embodying descriptions of
natural objects. To this there should be subjoined some
short and clear grammatical rules, giving accurate direc-
tions for writing, pronouncing, forming, and using the
words of the language.

22. The Palatium should contain diverse discourses on
all matters, expressed in a varied and elegant style, with
marginal references to the authors from which the several
phrases are borrowed. At the end there should be given
rules for altering and paraphrasing sentences in a thousand
different ways.

23. The Thesaurus will be the name given to the
classic writers who have written on any matter with serious
intent and in a good style, with the addition of rules
relating to the observation and collection of noteworthy
passages and to the accurate translation (a most important
matter) of idioms. Of these authors, some should be
chosen to read in school; of others, a catalogue should be
THE METHOD OF LANGUAGES

formed, so that if any one desire to look up any subject in the authors who have written on it, he may be able to find out who they are.

24. By subsidiary books are meant those by whose help the school-books may be used with greater speed and with more result.

For the Vestibulum a small vocabulary, both Vernacular-Latin and Latin-Vernacular, should be provided.

For the Janua an etymological Latin-Vernacular dictionary, giving the simple words, their derivatives, their compounds, and the reason for the meanings attached.

For the Palatium a phraseological dictionary in the Vernacular, in Latin (and if necessary in Greek), forming a compendium of the various phrases, synonyms, and periphrases that occur in the Palatium, with references to the places where they are to be found.

Finally, for the completion of the Thesaurus, a comprehensive lexicon (Vernacular-Latin and Latin-Greek) which shall embrace, without exception, every point in each language. This should be carried out in a scholarly and accurate manner, care being taken that fine shades of meaning in the several languages be made to correspond, and that suitable parallels be found for idioms. For it is not probable that there exists any language so poor in words, idioms, and proverbs that it could not furnish an equivalent for any Latin expression, if judgment were used. At any rate, accurate renderings could be devised by any one who possessed sufficient skill in imitating, and in producing a suitable result from suitable material.

25. No such comprehensive dictionary has hitherto been produced. A Polish Jesuit, G. Cnapius, has, it is true, done good service to his countrymen by his work entitled A Thesaurus of Polish, Latin, and Greek; but in this work there are three defects. Firstly, the collection of vernacular words and phrases is incomplete. Secondly, he has not observed the order that we suggested above, since individual, figurative, and obsolete words are not arranged under separate headings, though in this way the
peculiarities, the elegances, and the resources of both languages equally would be illustrated. For he has given a number of Latin renderings for each word and phrase of Polish, while according to my plan only one, but that an exact equivalent, should be given. In this way, my dictionary would be of great service to those translating books from Latin into the vernacular, and vice versa. Thirdly, in Cnapius' Thesaurus there is a great lack of method in the arrangement of examples. These should not be carelessly heaped together. First, simple illustrations, drawn from history, should be given, then more ambitious ones taken from the orators, then the more complex and uncommon usages of poets, and finally the uses that are obsolete.

26. But a detailed account of this comprehensive dictionary must be left for another time, as must also the further particulars of the Vestibulum, the Janua, the Palatium, and the Thesaurus, by means of which languages can be acquired with unfailing accuracy. Of these it will be fitting to speak when we deal with the several classes in detail.
CHAPTER XXIII

THE METHOD OF MORALS

1. So far we have discussed the problem of teaching and learning the sciences and the arts with greater readiness. We should, however, bear in mind the remark of Seneca (Epist. 89): "We ought not to learn these things, but rather to have learned them." They are, indeed, nothing but a preparation for more important matters, and as he says, "our beginnings, and not our completed works." What then is our true work? It is that study of wisdom which elevates us and makes us steadfast and noble-minded — the study to which we have given the name of morality and of piety, and by means of which we are exalted above all other creatures, and draw nigh to God Himself.

2. We must therefore see how this art of instilling true virtue and piety may be elaborated on a definite system, and introduced into schools, that we may with justice be able to call them the "forging-places of humanity."

3. The art of shaping the morals is based upon the following sixteen fundamental rules:

   (i.) All the virtues, without exception, should be implanted in the young.

   For in morality nothing can be omitted without leaving a gap.

   4. (ii.) Those virtues which are called cardinal should be first instilled; these are prudence, temperance, fortitude, and justice.

   In this way we may ensure that the structure shall not
be built up without a foundation, and that the various parts shall form a harmonious whole.

5. (iii.) Prudence must be acquired by receiving good instruction, and by learning the real differences that exist between things, and the relative value of those things.

A sound judgment on matters of fact is the true foundation of all virtue. Well does Vives say: "True wisdom consists in having a sound judgment, and in thus arriving at the truth. Thus are we prevented from following worthless things as if they were of value, or from rejecting what is of value as if it were worthless; from blaming what should be praised, and from praising what should be blamed. This is the source from which all error arises in the human mind, and there is nothing in the life of man that is more disastrous than the lack of judgment through which a false estimate of facts is made. Sound judgment," he proceeds, "should be practised in early youth, and will thus be developed by the time manhood is reached. A boy should seek that which is right and avoid that which is worthless, for thus the practice of judging correctly will become second nature with him."

6. (iv.) Boys should be taught to observe temperance in eating and in drinking, in sleeping and in waking, in work and in play, in talking and in keeping silence, throughout the whole period of their instruction.

In this relation the golden rule, "Nothing in excess," should be dinned into their ears, that they may learn on all occasions to leave off before satiety sets in.

7. (v.) Fortitude should be learned by the subduing of self; that is to say, by repressing the desire to play at the wrong time or beyond the proper time, and by bridling impatience, discontent, and anger.

The principle which underlies this is that we should accustom boys to do everything by reason, and nothing under the guidance of impulse. For man is a rational animal, and should therefore be led by reason, and, before action, ought to deliberate how each operation should be performed, so that he may really be master of his own
actions. Now, since boys are not quite capable of such a deliberate and rational mode of procedure, it will be a great advance towards teaching them fortitude and self-control if they be forced to acquire the habit of performing the will of another in preference to their own, that is to say, to obey their superiors promptly in everything. "Those who train horses aright," says Lactantius, "first teach them to obey the reins," and he who wishes to instruct boys should commence by accustoming them to obey his orders. We may indeed cherish a hope that the turmoil with which the world is overwhelmed will be replaced by a better condition of affairs, if, in early youth, men learn to yield to one another and to be guided by reason in all that they do.

8. (vi.) The young should learn to practise justice by hurting no man, by giving each his due, by avoiding falsehood and deceit, and by being obliging and agreeable.

Boys must be trained to act in this way, as we said above, by the method prescribed in the following canons.

9. (vii.) The kinds of fortitude that are especially necessary to the young are frankness and endurance of toil.

For since life must be spent in intercourse with others and in action, boys must be taught to look men in the face and to meet honest toil without flinching. Otherwise they may become recluses and misanthropes, or idlers and cumberers of the earth. Virtue is practised by deeds and not by words.

10. (viii.) Frankness is acquired by constant intercourse with worthy people, and by behaving, while in their presence, in accordance with the precepts that have been given.

Aristotle educated Alexander in such a manner that, when twelve years of age, he could suit himself to every kind of society, to that of kings, of the ambassadors of kings and of nations, of learned and unlearned men, of townspeople, of countrymen, and of artisans, and could ask suitable questions or give suitable answers on any subject that arose in conversation. In order that the
young who are subjected to our comprehensive scheme of education may learn to imitate this, rules for conversation should be written, and the practice of them, by daily intercourse with tutors, schoolfellows, parents, and servants, should be insisted upon; masters also should take great care to correct any tendency to carelessness, forwardness, boorishness, or coarseness.

11. (ix.) Boys will learn to endure toil if they are continually occupied, either with work or with play.

It makes no difference what is done, or why it is done, if only the boy be occupied. Much can be learned in play that will afterwards be of use when the circumstances demand it. It is by working, therefore, that we must learn how to work, just as we learn how to act by acting (as we saw above); and in this way the continued occupations of mind and body, in which, at the same time, all over-pressure must be avoided, will produce an industrious disposition, and make a man so active that sluggish ease will be intolerable to him. Then will be seen the truth of Seneca's words: "It is toil that nourishes noble minds."

12. (x.) The cognate virtue of justice, or promptness and willingness to serve others, must be diligently cultivated in the young.

The abominable vice of selfishness is inherent in our corrupt nature, and through it each man thinks of nothing but his own welfare, and troubles his head about no one else. This is a great source of confusion in life, since all are occupied with their own affairs and neglect the common good. The true object of life must therefore be diligently instilled into the youth, and they must be taught that we are born not for ourselves alone, but for God and for our neighbour, that is to say, for the human race.

Thus they will become seriously persuaded of this truth and will learn from their boyhood to imitate God, the angels, the sun, and the more noble of things created, that is to say, by desiring and striving to be of service to as many as possible. Thus will the good fortune of private and of public life be assured, since all men will be
ready to work together for the common good, and to help one another. And they actually will do so if they have been properly taught.

13. (xi.) Virtue must be inculcated at a very early stage before vice gets possession of the mind.

For if you do not sow a field with good seed it will produce nothing but weeds of the worst kind. But if you wish to subdue it, you will do so more easily and with a better hope of success if you plough it, sow it, and harrow it in early spring. Indeed, it is of the greatest importance that children be well trained in early youth, since a jar preserves for a long time the odour with which it has been imbued when new.

14. (xii.) The virtues are learned by constantly doing what is right.

We have seen in chaps. xx. and xxi. that it is by learning that we find out what we ought to learn, and by acting that we learn to act as we should. So then, as boys easily learn to walk by walking, to talk by talking, and to write by writing, in the same way they will learn obedience by obeying, abstinence by abstaining, truth by speaking the truth, and constancy by being constant. But it is necessary that the child be helped by advice and example at the same time.

15. (xiii.) Examples of well-ordered lives, in the persons of their parents, nurses, tutors, and school-fellows, must continually be set before children.

For boys are like apes, and love to imitate whatever they see, whether good or bad, even though not bidden to do so; and on this account they learn to imitate before they learn to use their minds. By "examples," I mean living ones as well as those taken from books; in fact, living ones are the more important because they make a stronger impression. And therefore, if parents are worthy and careful guardians of domestic discipline, and if tutors are chosen with the greatest possible care, and are men of exceptional virtue, a great advance will have been made towards the proper training of the young in morals.
16. (xiv.) But, in addition to examples, precepts and rules of conduct must be given.

In this way imitation will be supplemented and strengthened (on this point the reader may refer to our remarks in chap. xxi. canon ix.). Rules of life should therefore be collected from Holy Scripture and from the sayings of wise men, and should deal with questions such as: “Why should we strive against envy?” “With what arms should we fortify ourselves against the sorrows and the chances of life?” “How should we observe moderation in joy?” “How should anger be controlled?” “How should illicit love be driven out?” and similar questions, according to the age of the pupil.

17. (xv.) Children must be very carefully guarded from bad society, lest they be infected by it.

For, owing to our corrupt nature, evil clings to us readily. The young must therefore be carefully shielded from all sources of corruption, such as evil society, evil conversation, and worthless books (for examples of vice, whether they make their entrance through the eyes or through the ears, are poison to the mind). And finally, sloth should be guarded against, lest through idleness the young be led to evil deeds or contract a tendency to indolence. The important thing is that they be kept continually employed either with work or with play. Idleness should never be permitted.

18. (xvi.) Since it is impossible for us to be so watchful that nothing evil can find an entrance, stern discipline is necessary to keep evil tendencies in check.

For our enemy Satan is on the watch not only while we sleep, but also while we wake, and as we sow good seed in the minds of our pupils he contrives to plant his own weeds there as well, and sometimes a corrupt nature brings forth weeds of its own accord, so that these evil dispositions must be kept in check by force. We must therefore strive against them by means of discipline, that is to say, by using blame or punishment, words or blows, as the occasion demands. This punishment should always be administered
on the spot, that the vice may be choked as soon as it shows itself, or may be, as far as is possible, torn up by, the roots. Discipline, therefore, should ever be watchful, not with the view of enforcing application to study (for learning is always attractive to the mind, if it be treated by the right method), but to ensure cleanly morals.

But of discipline we will treat more particularly in chap. xxxi.
CHAPTER XXIV

THE METHOD OF INSTILLING PIETY

1. Piety is the gift of God, and is given us from on high by our counsellor and guide, the Holy Spirit. But, since the Holy Spirit usually employs natural agencies, and has chosen parents, teachers, and ministers who should faithfully plant and water the grafts of Paradise (1 Cor. iii. 6-8), it is right that these should appreciate the extent of their duties.

2. We have already explained what we mean by piety, namely, that (after we have thoroughly grasped the conceptions of faith and of religion) our hearts should learn to seek God everywhere (since He has concealed Himself with His works as with a curtain, and, invisibly present in all visible things, directs all, though unseen), and that when we have found Him we should follow Him, and when we have attained Him should enjoy Him. The first we do through our understanding, the second through our will, and the third through the joy arising from the consciousness of our union with God.

3. We seek God by noticing the signs of His divinity in all things created. We follow God by giving ourselves up completely to His will, both to do and to suffer whatever shall have seemed good to Him. We enjoy God by so acquiescing in His love and favour that nothing in heaven or on earth appears to us more to be desired than God Himself, that nothing appears pleasanter to think of, and nothing sweeter than to sing His praises; thus our hearts are joined to His in love.

218
4. The sources from which we can draw this exaltation are three, and the manner in which we can draw from them is threefold.

5. These sources are Holy Writ, the world, and ourselves. The first is the Word of God, the second is His handiwork, and the third is inspired by Him. There is no doubt that we can derive the knowledge and the love of God from the Scriptures. The very heathen testify that piety can be derived from the world and from the wise contemplation of the marvellous works of God contained in it; for they, by nothing but the contemplation of the world, were brought to revere the Godhead. This is shown by the examples of Socrates, Plato, Epictetus, Seneca, and others. But still, in the case of these men, to whom no special revelation from on high had been given, this feeling of love was imperfect, and wrongly directed. That those who seek to gain a knowledge of God from His word as well as from His works are filled with the deepest love for Him, is shown by the instances of Job, Elihu, David, and other pious men.

6. The manner of drawing piety from these sources is threefold: meditation, prayer, and examination.

"These three," says Luther, "make a theologian; but indeed they are essential to make a true Christian."

7. Meditation is the constant, attentive, and devoted consideration of the works, the words, and the goodness of God; the thoughtful acknowledgment that it is from the good-will of God alone (either active or permissive) that all things come, and that all the counsels of the divine will attain their end in the most marvellous ways.

8. Prayer is the frequent, or rather the continual, yearning after God, and the supplication that He may sustain us in His mercy and guide us with His Spirit.

9. Examination is the continual testing of our progress in piety, and may come from ourselves or from others. Under this head come human, devilish, and divine temptations. For men should examine themselves to see if they are faithful, and do the will of God; and it is necessary that we should be tested by other men, by our friends, and
by our enemies. This is the case when those who are set over others are vigilant and attentive, and, by open or by secret scrutiny, try to find out what progress has been made; or when God places an adversary by our side to teach us to find our refuge in Him, and to show us how strong our faith is. Finally, Satan himself is sent by God, or comes against us of his own accord, that the state of our hearts may be made evident.

These three modes, therefore, must be instilled into the Christian youth, that they may learn to raise their hearts to Him who is the first and the last of all things, and may seek rest for their souls in Him alone.

10. The special method is contained in twenty-one rules.

(i.) Care should be taken to instil piety in early childhood.

For not to put off such instruction is advantageous, and to put it off is dangerous, since it is only reasonable to begin with what naturally comes first, and is the most important. But what is more important than piety? What else is profitable for all things, having promise of the life which now is, and of that which is to come? (Tit. iv. 8). This is the one thing needful (Luke x. 42), to seek the Kingdom of God, since all things shall be added to him who does so (Matt. vi. 33). To postpone this is hazardous, since, unless the mind be imbued with the love of God when young, it is easy for a silent contempt of the Godhead and for profanity to make their entrance, and when once they have done so, it is difficult, if not impossible, to dislodge them. Thus the prophet, complaining of the horrible impiety of his people, says that there are none left whom God can teach, save “them that are weaned from the milk and drawn from the breasts,” that is to say, the young (Isaiah xxviii. 9), and another prophet says that it is impossible to convert to well-doing those that are accustomed to do evil (Jeremiah xiii. 23).

11. (ii.) Therefore, as soon as children can use their eyes, their tongues, their hands, and their feet, let them learn to
look towards heaven, to stretch their hands upwards, to utter the names of God and of Christ, to bend the knee before His unseen majesty, and to revere it.

It is not so difficult to teach these things to children as those imagine, who, not realising how important it is for us to tear ourselves away from Satan, from the world, and from ourselves, pay little consideration to a matter of such gravity. At first the children will not understand the true nature of what they are doing, since their intelligence is still weak; but what is of importance is that they learn to do that which subsequent experience will teach them to be right. For, when they have got into the habit of acting as they should, it will be easier to explain to them why such conduct is good, and how it is best carried out. God has commanded to consecrate all first-fruits to Him; why not, therefore, the first-fruits of our thoughts, of our utterances, of our movements, and of our actions?

12. (iii.) While it is still possible to influence boys, it is of great importance to impress upon them that we are not here for the sake of this life, but are destined for eternity; that our life on earth is only transitory, and serves to prepare us for our eternal home.

This can easily be taught by the examples of infants, boys, youths, and old men who are daily snatched away by death. These facts should be diligently impressed on the young, that they may realise how very transitory our life on earth is.

13. (iv.) They should also be taught that our only business on earth should be to prepare for the next world.

For it would be foolish to pay attention to those things which will be taken from us, and to neglect those things which will accompany us into eternity.

14. (v.) They should then be taught that the life to which men go when they leave this earth, is twofold: either a blessed life with God, or a wretched one in hell, and that both are everlasting.

This may be demonstrated by the example of Lazarus and the rich man; for the soul of the former was carried
away by angels into heaven, while that of the latter was carried by devils into hell.

15. (vi.) And that those are thrice happy, who order their conduct in such a way that they are found worthy to stand in God's presence.

For apart from God, the source of light and of life, there is nothing but darkness, terror, agony, and everlasting death that knows no end; so that it were better that they had never been born, who stray from God and cast themselves into the pit of eternal destruction.

16. (vii.) But that those who have communed with God on earth, will go to Him after death.

As did Enoch and Elias, both while living, and others also (Gen. v. 24).

17. (viii.) That those commune with God who keep Him continually before their eyes, fear Him, and fulfil His word.

And that this is the whole duty of man (Eccles. xi. 13), to which Christ referred when He said, "There is but one thing needful" (Luke x. 42). This is what Christians should ever have on their lips and in their hearts, lest, like Martha, they be too much engrossed with the cares of this life.

18. (ix.) They should, therefore, acquire the habit of referring to God all that they see, hear, touch, do, and endure on earth.

Instances of this should be given. Those, for instance (it may be pointed out), who devote themselves to letters and a life of contemplation, should do so with but one object in view, namely, that they may see in everything the power, the wisdom, and the goodness of God, that they may be filled with love for Him, and may unite themselves so fast to Him in love that they can never be torn away. Those, again, who are engaged in practical pursuits, such as agriculture or mechanics, these have to seek bread and the necessaries of life; but they should do so merely that they may live in decent comfort, and should strive to live thus solely that they may be enabled to serve God with a quiet and cheerful spirit, and that, by serving Him and proving acceptable to Him, they may be united with Him
eternally. Those who have other ends in view deviate from God's will and from God Himself.

19. (x.) From the very outset they should learn to find their chief occupation in those things that lead directly to God: in reading the Scriptures, in religious ceremonies, and in other good works.

For the perusal of the Scriptures renews and fosters our acquaintance with God, religious ceremonies create a link between God and man, and good works strengthen this link, for they show that we really observe the Word of God. These three should be seriously commended to all who are destined to lead a Godly life (as are all the Christian youth, dedicated to God through baptism).

20. (xi.) The Holy Scriptures must be the Alpha and the Omega of Christian schools.

Hyperius said that a theologian was born of the Scriptures, and we may find this observation at greater length in the Apostle Peter, who says that the sons of God are born of incorruptible seed, through the Word of God that liveth and abideth (1 Peter i. 23).

In Christian schools, therefore, God's Book should rank before all other books; that, like Timothy, all the Christian youth may, from boyhood, know the sacred writings which are able to make them wise unto salvation (2 Tim. iii. 15), and may be nourished in the words of the faith (1 Tim. iv. 6). On this subject Erasmus has written well in his Paraclesis, or Exhortation to the Study of Christian Philosophy. "The Holy Scripture" (he says) "is equally suitable to all, is within the capacity of little ones, nourishes them with milk, cherishes them, sustains them, and does all for them until they grow up in Christ. But, while it can be comprehended by the lowest intelligences, it is none the less an object of wonder to the highest. There is no age, no sex, no rank of life to which it is unsuitable. The sun is not more the common property of mankind than is the teaching of Christ. It rejects none save those who hold themselves at a distance." He continues, "Would that it were translated into all languages,
that it might be known by the Turks and the Saracens,
and by the Scotch and the Irish as well. Many would
mock, it is true, but some would be won over. Would
that the ploughman might sing it at his plough, that the
weaver might repeat it at his loom, that the traveller
might beguile the tedium of the journey by its sacred story,
and that the conversations of Christians were taken from
its pages; for our daily conversation represents our true
character. Let each one get and read as much of Holy
Writ as he can. Let him who is behind not envy him
who is in front. Let him who is in front beckon forward
him who is behind, and despise him not. Why do we
confine to a few the book that contains the faith of all?"
And near the end, "May all whom we have dedicated to
Christ in baptism be imbued with His teaching while in
the arms of their parents and among the caresses of their
nurses. For that which the mind first drinks in, sinks
deepest and remains longest. Let our first babbling be of
Christ, and let our infancy be modelled upon His Evan-
gelists, which should be set before boys in such a way that
they may like them. In these studies they should be
trained, until by a silent increase they develope into men,
whose strength is in Christ. Happy is he whom death
snatches away while engaged on this study. Let us all,
therefore, drink in God's Word with our whole hearts, let
us embrace it, let us die while occupied with it, let us be
converted into it, since our morals are so intimately
connected with our studies." In his Compendium of Theology
also he says: "In my opinion, it would not be a waste of
time to learn the Holy Book off by heart, even though we
did not understand it, as says St. Augustine."

Christian schools, therefore, should resound not with
Plautus, not with Terence, not with Ovid, not with Aris-
totle, but with Moses, David, and Christ, and methods
should be devised by which the Bible may be given to
children dedicated to God (for all the children of Christians
are holy) (1 Cor. vii. 14) as a means of learning their
A B C; for thus they would grow familiar with it. For as
language is made up of the sounds and the symbols of letters, thus is the whole structure of religion and piety formed out of the elements of Holy Scripture.

21. (xii.) Whatever is learned from Scripture should convey a lesson of faith, charity, and hope.

These are the three noblest dispositions, and to these everything that God has seen good to reveal to us in His Word has reference. For he reveals some things to us that we may believe them, others He commands us that we may do them, and others again He promises that we may expect them from His mercy, both in this and in the future world. In the whole Bible nothing occurs that cannot be brought under one of these heads. All, therefore, should be taught to understand and to read intelligently what God has revealed.

22. (xiii.) Faith, charity, and hope should be taught for practical use.

From the very beginning it is necessary to form practical and not theoretical Christians, if we wish to form true Christians at all. For religion is a real thing and not a reflection of reality, and should prove its reality by the practical results that it produces, just as a seed that is planted in good earth soon germinates. Hence the Scripture requires a "working faith" (Gal. v. 6), calls faith apart from works "barren" (James ii. 20), and asks for a "living hope" (1 Peter i. 3). Hence the constant injunction, that things are revealed from on high that we should do them. Christ also says: "If ye know these things, blessed are ye if ye do them" (John xiii. 17).

23. (xiv.) Faith, charity, and hope will be taught in a practical manner, if boys and all men are taught to believe implicitly in all that God reveals, to do all that He commands, and to expect all that He promises.

It should be carefully impressed on the young that, if they wish the Word of God to supply them with divine strength, they should bring to it a humble and devoted heart, prepared to submit itself to God on all occasions, and actually doing so at the time. The sunlight reveals
nothing to him who refuses to open his eyes, nor can a banquet satisfy him who refuses to eat; and in the same way the divine light supplied to our minds, the rules given for our actions, and the happiness promised to those who fear God, are all in vain unless they are received with prompt faith, earnest charity, and firm hope. Thus, Abraham, the father of the faithful, trusted the Word of God and believed things incredible to the reason; obeyed the commands of God, no matter how hard they were (when bidden leave his native land and sacrifice his son); and hoped for things that seemed impossible, trusting in the promises of God—which living and active faith was counted to him for righteousness. All, therefore, who devote themselves to God, should be taught to fulfil these duties in their own persons.

24. (xv.) Whatever is taught to the young in addition to the Scriptures (sciences, arts, languages, etc.) should be taught as purely subordinate subjects. In this way it will be made evident to the pupils that all that does not relate to God and to the future life is nothing but vanity.

Socrates is praised by the ancients because he turned philosophy from its barren and thorny speculations and brought it to bear on the province of morals. The Apostles professed to recall Christians from the thorny questions of the law and to lead them to the sweet charity of Christ (1 Tim. i. 5 seq.), and in the same way many modern theologians urge us to leave confused controversies, that destroy the Church far more than they build it up, and to attend to our own consciences and the practice of piety.

O that God would have pity on us, that we might find some universal method by which all that occupies the mind of man might be brought into relation with God, and that we might learn to convert the business of this life, in which all mankind is immersed, into a preparation for the life to come! This would, indeed, be a sacred ladder on which our minds might mount to the eternal protector of all things, to the source of true happiness.

25. (xvi.) All should be taught to reverence God both
inwardly and outwardly. For inward without outward reverence tends to grow faint, while outward without inward reverence degenerates into hypocrisy.

The outward worship of God consists in conversing about Him, in preaching and hearing His Word, in adoring Him on bended knee, in singing His praises in hymns, and in attending to the Sacraments and the other services of the Church, public and private. The inward worship of God consists of continual meditation on the divine presence, of fearing and loving God, of abnegation and resignation of self, and of the ready will to do or to suffer all that God desires. These two forms of worship must be joined together, and not torn asunder; not only because it is right that God should be glorified in our bodies and in our minds, which belong to Him (1 Cor. vi. 20), but also because they cannot be separated without danger. Outward ceremonies without inward truth are an abomination to God, who says: "Who demands these things from you?" (Isaiah i.), "for He is a spirit and must be worshipped in spirit and in truth" (John iv.). But, since we are not merely spirits but have bodies and senses as well, it is necessary for our senses to be outwardly stimulated, that we may inwardly do what is right in spirit and in truth. On this account God, though He lays more stress on inward worship, ordained outward ceremonies and wishes them to be observed. Christ freed the worship of the New Testament from ceremony and taught that God should be worshipped in spirit and in truth, yet He Himself bent His head when He prayed to His Father, and continued His prayer for nights together; used to attend religious meetings, heard and questioned the doctors of the law, preached the Word, and sang hymns. Therefore when we educate the young, we should educate them thoroughly, externally and internally, since otherwise we may produce either hypocrites, that is to say, superficial, fraudulent, and false worshippers of God, or fanatics, who delight in their own visions, and through their contempt of outward form undermine the Church, or, finally, luke-
warm Christians, in whom the stimulus of external or the reality of internal worship is wanting.

26. (xvii.) Boys should be carefully habituated to the outward works which are commanded by God, that they may know that it is true Christianity to express faith by works.

Such works are the exercise of temperance, justice, pity, and patience, which should continually occupy our attention. "For, unless our faith brings forth such fruit it is manifestly dead" (James ii.). But it must be living if it is to bring us salvation.

27. (xviii.) They should also learn to distinguish carefully the objects of the blessings and of the judgments of God, that they may make a good use of them.

Fulgentius 35 (Letter II. to Gallas) divides the blessings of God into three classes. According to him, some are to last for ever, others are to help us to attain eternity, while others are only for the use of this present life. Of the first kind are the knowledge of God, the joy of the Holy Spirit, and the love of God that fills our hearts. Of the second kind are faith, hope, and compassion for our neighbours. Of the third kind are health, riches, friends, and the other external goods that of themselves make us neither happy nor unhappy.

In the same way the judgments or chastisements of God are of three kinds. Some (whom God wishes to spare in the life everlasting) are seized on earth and are tortured that they may be purified and whitened (Dan. xi. 35; Rev. vii. 14), as was the case with Lazarus. Others are spared here that they may be punished in eternity, as was the Rich Man. While the punishments of others begin here and are continued in eternity, as is the case with Saul, Antiochus, Herod, Judas, etc.

Men, therefore, must be taught to distinguish all these from one another, that they may not be deceived by the good things of the flesh and give precedence to what is transitory, that they may realise that present ills are less to be feared than hell-fire, and "that they should not fear
those who can only kill the body and have no further power, but Him who can destroy the body and can also thrust the soul down to hell” (Luke xii.).

28. (xix.) They should also be told that the safest path of life is the path of the Cross; that Christ the King of Life has trodden it before us, and invites to it and leads along it those whom He loves best.

The mystery of our salvation was consummated on the Cross and depends on the Cross; for by it the old Adam was slain that the new Adam, fashioned after God’s image, might live. Those, therefore, whom God loves, He chastises and crucifies with Christ, that when they rise with Christ He may set them on His right hand in heaven. Now, though this lesson of the Cross tells the power of God to save those who believe, to the flesh it is foolishness and an offence (1 Cor. i. 18). It is therefore very necessary to teach this lesson to Christians with great care, that they may understand that they cannot be the disciples of Christ unless they deny themselves, bear the Cross of Christ on their shoulders (Luke xiv. 26), and are prepared throughout their whole lives to follow God wherever He may lead them.

29. (xx.) Care must be taken that, while all this is being taught, no conflicting examples come in the way.

That is to say, the boys must not hear or see blasphemies, perjuries, or other acts of impiety, but, whichever way they turn, should encounter nothing but reverence for the Deity, observance of religion, and conscientiousness. Evil conduct, also, whether at home or at school, should always be severely punished, and, if the punishment for profanity be always greater than for offences against Priscian or for other faults, it will be impressed upon them that the former error is the more important to guard against.

30. (xxi.) In this corrupt state of the world and of human nature we never make as much progress as we ought, or, if we do advance, are filled with complacency and spiritual pride, through the depravity of our flesh.

Now this is a very great danger (for God resists the proud), and therefore all Christians should be taught in
their youth that our endeavours and our works are of no avail, unless Christ, the Lamb of God who takes away the sins of the world, help us with His perfection. On Him we must call and Him we must trust.

We shall thus have finally placed the hope of our salvation in safety, when we have laid the burden on Christ, the corner-stone. For He is the culminating point of all perfection in heaven and on earth, and is the one and only originator and guardian of our faith, our charity, our hope, and our salvation. For this reason God sent Him from heaven that he might become Immanuel (or God in man) and unite all men in God, and that, living with purity in the life which He had assumed, He might give men the example of a divine life; that by His innocent death He might expiate the sins of the world in His person, and might wash us clean with His blood; that He might show His victory over death by His resurrection, and ascending into heaven might send the Holy Ghost, the pledge of our salvation; and that He might thus rule us and preserve us, and, finally, take us to Himself, that we may be with Him and see His glory.

31. Thus to the eternal Saviour of all men, with the Father and the Holy Ghost, be praise, and honour, and blessing, and glory, for evermore. Amen.

32. It remains to draw up a detailed method for the several classes.
CHAPTER XXV

IF WE WISH TO REFORM SCHOOLS IN ACCORDANCE WITH THE LAWS OF TRUE CHRISTIANITY, WE MUST REMOVE FROM THEM BOOKS WRITTEN BY PAGANS, OR, AT ANY RATE, MUST USE THEM WITH MORE CAUTION THAN HITHERTO.34

1. Resistless necessity compels us to treat at length a subject which we have touched on in the previous chapter. If we wish our schools to be truly Christian schools, the crowd of Pagan writers must be removed from them. First, therefore, we will set forth the reasons which underlie our views, and then the method of treating these ancient writers so that, in spite of our caution, their beautiful thoughts, sayings, and deeds may not be lost to us.

2. Our zeal in this matter is caused by our love of God and of man; for we see that the chief schools profess Christ in name only, but hold in highest esteem writers like Terence, Plautus, Cicero, Ovid, Catullus, and Tibullus. The result of this is that we know the world better than we know Christ, and that, though in a Christian country, Christians are hard to find. For with the most learned men, even with theologians, the upholders of divine wisdom, the external mask only is supplied by Christ, while the spirit that pervades them is drawn from Aristotle and the host of heathen writers. Now this is a terrible abuse of Christian liberty, a shameless profanation, and a course replete with danger.

3. Firstly, our children are born for heaven and are
reborn through the Holy Ghost. They must therefore be educated as citizens of heaven, and their chief instruction should be of heavenly things, of God, of Christ, of the angels, of Abraham, of Isaac, and of Jacob. This instruction should take place before any other, and all other knowledge should be shielded from the pupil; firstly, because of the uncertainty of life, that no one may be snatched away unprepared, and secondly, because first impressions are the strongest, and (if they are religious impressions) lay a safe foundation for all that follows in life.

4. Secondly, God, though He made provision of every kind for His chosen people, gave them no school other than His own Temple, where He Himself was the Master, we were the pupils, and His oracles were the subject taught. For thus He speaks by Moses: "Hear, O Israel, the Lord our God is one God: and thou shalt love the Lord thy God with all thine heart, and with all thy soul, and with all thy might. And these words, which I command thee this day, shall be upon thine heart; and thou shalt teach them diligently unto thy children, and shalt talk of them when thou sittest in thine house, and when thou walkest by the way, and when thou liest down, and when thou risest up" (Deut. vi. 4). And by Isaiah: "I am the Lord thy God, which teacheth thee to profit, which leadeth thee by the way that thou shouldst go" (xlviii. 17); and again, "Should not a people seek unto their God?" Christ also says: "Search ye the Scriptures" (John v. 39).

5. God has shown by the following words that His voice is the brightest light for our understanding, the most perfect law for our actions, and the surest support for our weakness. "Behold, I have taught you statutes and judgments! Keep therefore and do them; for this is your wisdom and your understanding in the sight of the peoples, which shall hear all these statutes and say: Surely this great nation is a wise and understanding people" (Deut. iv. 5, 6). To Joshua, also, He speaks thus: "This book of the law shall not depart out of thy
mouth, but thou shalt meditate therein day and night. For then thou shalt make thy way prosperous and thou shalt have good success” (Jos. i. 8). By David also He says: “The precepts of the Lord are right, rejoicing the heart: the commandment of the Lord is pure, enlightening the eyes” (Psalm xix. 8). Finally, the Apostle bears witness “that every scripture inspired of God is profitable for teaching, etc., that the man of God may be complete” (2 Tim. iii. 16, 17). The wisest of men (by this I mean truly enlightened Christians) have made the same assertion. Chrysostom has said: “What it is needful to know, and what it is not needful to know, that we can learn from the Scriptures.” And Cassiodorus35 says: “The Scriptures are a heavenly school, a guide through life, the only true source of information. To search for the true meaning of them should occupy the student’s whole time, and leave him no leisure to be led astray by philology.”

6. God expressly forbade His chosen people to have anything to do with the learning or the customs of the heathen: “Learn not the way of the nations” (Jer. x. 2); and again, “Is it because there is no God in Israel that ye go to inquire of Baalzebub the God of Ekron?” (2 Kings i. 3); “Should not a people seek unto their God? on behalf of the living should they seek unto the dead? To the law and to the testimony! if they speak not according to this word, surely there is no morning for them” (Isaiah viii. 19, 20). And why? Surely because “all wisdom cometh from the Lord, and is with him for ever. To whom else hath the root of wisdom been revealed?” (Ecclesiasticus i. 1, 6); “Although they have seen light and dwelt on the earth, the way of knowledge have they not known. Nor understood the paths thereof, etc. It hath not been heard of in Chanaan, neither hath it been seen in Theman. The Agarenes that seek wisdom upon earth, the authors of fables and searchers out of understanding, have not known the way of wisdom. But he that knoweth all things knoweth it and hath found out all the way of knowledge and hath
given it unto Jacob his servant and Israel his beloved” (Baruch iii. 20, 21, 22, 23, 32, 36, 37); “He hath not dealt so with any nation, and as for his judgments, they have not known them” (Psalm cxliv. 20).

7. Whenever His people went aside from His laws to the snares of man’s imagination, God used to blame not only their folly in forsaking the fountain of wisdom (Baruch iii. 12), but the twofold evil that they had committed, in forsaking Him, the fountain of living waters, and hewing them out broken cisterns that could hold no water (Jer. ii. 13). Through the agency of Hosea He complained also that His people held too much intercourse with other nations, saying: “Though I write for him my law in ten thousand precepts, they are counted as a strange thing” (Hos. viii. 12). But, I ask, is not this what those Christians are doing who hold heathen books in their hands night and day, while of the sacred Word of God they take no account, as if it did not concern them? And yet, as God bears witness, it is no vain thing, but our very life (Deut. xxxii. 47).

8. Therefore the true Church and the true worshippers of God have sought for no teaching other than the Word of God, from which they have drawn the true and heavenly wisdom that is superior to all earthly knowledge. Thus David says of himself: “Thy commandments make me wiser than mine enemies,” and, “I have more understanding than all my teachers, for thy testimonies are my meditation” (Psalm cxix. 98, 99). Similarly Solomon, the wisest of mortals, confesses: “The Lord giveth wisdom; out of his mouth cometh knowledge and understanding” (Prov. ii. 6). The son of Sirach also testifies (in the prologue to his book) that his wisdom is drawn from the law and the prophets. Hence the exultation of the righteous when they see light in the light of God (Psalm xxxvi. 9); “O Israel, happy are we: for things that are pleasing to God are made known unto us” (Baruch vi. 4). “Lord, to whom shall we go? thou hast the words of eternal life” (John vi. 68).
9. The examples of all ages show us that it has been an occasion for stumbling whenever the Church has turned aside from the fountain of Israel. Of the Jewish Church, sufficient is known from the lamentations of the Prophets. As regards the Christian Church, we learn from history that a pure faith lasted as long as the Gospel, and nothing else, was preached by the Apostles and their successors. But as soon as the heathen entered the Church in numbers, and the ardour that existed at first grew cold, pagan books were read, at first in private and then in public, and the result was a great confusion of doctrine. The key of knowledge was lost by the very men who boasted that they alone possessed it, and from that time opinions without number were substituted for the articles of faith. Then did strife arise, whose end is not yet visible; charity grew cold, and piety disappeared. And thus, under the name of Christendom, paganism came into existence again, and still reigns supreme. For the threat of the Lord Jehovah had to be fulfilled: “If they speak not according to the Word of God, surely there is no morning for them” (Isaiah viii. 20). “Therefore the Lord hath poured out upon them the spirit of sleep, and hath closed their eyes, that all vision might become unto them as the words of a book that is sealed,” because they worshipped God in accordance with the teaching of man (Isaiah xxix. 10, 11, 13, 14). O, how truly in their case is fulfilled what the Holy Spirit says of the heathen philosophers: “They became vain in their reasonings, and their senseless heart was darkened” (Rom. i. 21). In short, if the Church is to be purified from uncleanness, there is only one way, and that is to put aside all the seductive teaching of man and return to the pure springs of Israel, and thus to give over ourselves and our children to the teaching and guidance of God and of His word. Thus at last will the prophecy come to pass, “And all thy children shall be taught of God” (Isaiah liv. 13).

10. Indeed our dignity as Christians (who have been made sons of God and heirs of the kingdom of heaven
through Christ) does not permit us to degrade ourselves and our children by allowing them to have an intimate acquaintance with pagan writers, and to read them with such approval. We do not choose parasites, fools, or buffoons, but serious, wise, and pious men as tutors for the sons of our kings and princes. Should we not blush, therefore, when we confide the education of the sons of the King of kings, of the brothers of Christ and heirs of eternity, to the jesting Plautus, the lascivious Catullus, the impure Ovid, that impious mocker at God, Lucian, the obscene Martial, and the rest of the writers who are ignorant of the true God? Those who, like them, live without the hope of a better life, and wallow in the mire of earthly existence, are certain to drag down to their own level whoever consorts with them. Christians, we have carried our folly far enough! Let us pause here. God calls us to better things, and it is good to obey His call. Christ, the eternal Wisdom of God, has opened a school for the sons of God in His own house; in which the supreme control is exercised by the Holy Spirit, and the professors and masters are the Prophets and the Apostles, all endowed with true wisdom, and all holy men, who, by their teaching and example, point out the way of truth and of salvation; where the pupils are the elect of God, the first-fruits of men, ransomed by God and by the Lamb; where the inspectors and guardians are the angels and archangels, the principalities and powers in heaven (Eph. iii. 10); and where true wisdom, which is of use to us in this world and the next, is taught on all subjects that the mind of man can grasp. For the mouth of God is the fountain from which all the streams of wisdom flow; the countenance of God is the torch from which the rays of true light are scattered; the Word of God is the root from which spring the shoots of true wisdom. Happy are they, therefore, who look on the face of God, listen to His words, and receive His sayings in their hearts. For this is the only true and infallible way to attain the true and eternal wisdom.
Nor can we omit all mention of the earnestness with which God forbade His people to have anything to do with the works of the heathen, and of the consequences that followed their disregard of His injunction: “The Lord will consume those nations from thy sight. But the graven images of their gods shall ye burn with fire. Thou shalt not covet the silver or gold that is on them, nor take it unto thee, lest thou be snared therein, for it is an abomination to the Lord thy God; and thou shalt not bring an abomination into thine house, and become a devoted thing like unto it” (Deut. vii. 22, 25, 26). And again: “When the Lord thy God shall cut off the nations from before thee, take heed to thyself that thou be not ensnared to follow them, after that they be destroyed from before thee, and that thou inquire not after their gods, saying, How do these nations serve their gods? But what thing soever I command you, that shall ye observe to do; thou shalt not add thereto nor diminish from it” (Deut. xii. 29). After their victory Joshua reminded them of this, and advised them to remove the idols (Jos. xxiv. 23); but they did not obey him, and these heathen productions became a snare for them, so that they continually fell into idolatry until both kingdoms were overthrown. Should not we, therefore, take warning by their example, and avoid their error?

“But books are not idols,” some one will say. I reply: They are the works of the heathen, whom God has destroyed from before the face of His Christian people, as He did of old. Nay, they are more dangerous than idols. For these only led away those who were fools at heart (Jer. x. 14), while books deceive even the wisest (Col. ii. 8). The former were works of men’s hands (as God used to say when chiding the folly of the idolaters), the latter are the works of the human understanding. The former dazzled the eyes by the brilliancy of their gold and silver, the latter blind the intelligence by the plausibility of their carnal wisdom. Do you still deny that pagan books are idols? What was it that led the Emperor Julian away
from Christ? What was it that so undermined the understanding of Pope Leo X. that he believed the history of Christ to be a mere fable? Under what influence did Cardinal Bembo dissuade Sadoleto from reading the Bible (saying that such folly was unsuitable for so great a man)? What is it that in these days leads so many learned Italians and others towards Atheism? Would that there were none in the reformed Church of Christ who have been drawn away from the Scriptures by Cicero, Plautus, and Ovid, writers that reek of death.

13. But it may be said: The abuse must be attributed not to the things, but to the persons. There are pious Christians to whom no harm is done by reading pagan authors. The Apostle replies: “We know that no idol is anything in the world: howbeit in all men there is not that knowledge (that is to say, the power of discerning). Take heed lest this liberty of yours become a stumbling-block to the weak” (1 Cor. viii. 4, 7, 9).

Now God in His mercy preserves many from destruction, and there is no excuse for us if, knowingly and willingly, we have anything to do with such snares (I mean the divers inventions of the human mind or of Satan’s cunning), since it is certain that some, nay most men, are unhinged by them and are led into Satan’s net. Let us rather obey God and not bring idols into our house, nor set up Dagon by the Ark of the Covenant, nor mingle the wisdom that is from on high with that which is earthly, bestial, and devilish, nor give any occasion for stirring up the anger of God against our sons.

14. Of a precisely similar nature was the event that Moses uses as an illustration. Nadab and Abihu, the sons of Aaron, and young priests (in ignorance of their duty), filled their censers with common, instead of with sacred, fire. For this they were smitten with fire by God, and died (Levit. x. 1). Now what are the children of Christians but a holy priesthood to offer up spiritual sacrifices to God? (1 Peter ii. 5). If we fill their censers, their minds, with strange fire, are we not handing them over to the
anger of God? For to a Christian soul all is strange, and should be strange, that has any other source than the Holy Spirit; and of such a kind are the ravings of the heathen philosophers and poets, as the Apostle bears witness (Rom. i. 21, 22; Col. ii. 8, 9). Not without reason did Jerome call poetry the wine of devils; since it intoxicates the incautious and sends them to sleep, and, while they sleep, plies them with monstrous opinions, dangerous temptations, and the foulest desires. We should therefore be on our guard against these philtres of Satan.

15. If we do not obey the wise counsels of God, the Ephesians will stand in judgment against us, for they, as soon as the light of divine wisdom shone upon them, burnt all their curious books, since these were henceforth useless to them as Christians (Acts xix. 19). The modern Greek Church also, although there exist the most excellent philosophical and poetical works, written by the Greeks of old, who were reputed the wisest of men, has forbidden its followers to read them under pain of excommunication. The result of this is that, although with the invasion of barbarism they have fallen into great ignorance and superstition, God has hitherto preserved them from being carried away by anti-Christian error. In this matter, therefore, we ought to imitate them, that (greater stress being laid on the reading of Scripture) the heathen darkness, which still remains, may be removed, and that in the light of God we may see light (Psalm xxxvi. 9). "O house of Jacob, come ye, and let us walk in the light of the Lord" (Isaiah ii. 5).

16. Let us now see by what reasonings the mind of man rebels against these injunctions, and winds about like a snake, seeking to avoid the necessity of obeying the Faith and serving God. The arguments used are as follows:

17. (i.) Great wisdom is to be found in the philosophers, the orators and the poets. I answer: Those are worthy of darkness who turn away their eyes from the light. Twilight is as mid-day to the owl, but animals, that are accustomed to light, think otherwise. O foolish men who
look for light in the darkness of the human reason! Lift up your eyes on high. The true light comes from heaven, from the Father of Light! Any light that is visible in human efforts arises from a few sparks that seem to shine because of the darkness that surrounds them; but what are a few sparks to us, in whose hands a blazing torch has been placed (the effulgent word of God)? If men investigate natural phenomena, they do but set the glass to their lips, without touching the wine; while in the Scriptures the Ruler of the Universe Himself recounts the mysteries of His works, and explains the nature of things created, visible and invisible. When the philosophers talk of morals, they are like birds that have been caught with quicklime, for they make great efforts to move without making any advance. But the Scriptures contain true descriptions of the virtues, with keen exhortations that pierce to the marrow.

When pagan writers wish to teach piety, they merely teach superstition, since they are not imbued with the true knowledge of God or of His will. "For, behold, darkness shall cover the earth, and gross darkness the peoples: but the Lord shall arise upon thee, and his glory shall be seen upon thee" (Isaiah lx. 2). Now the sons of light should be at liberty to journey to the sons of darkness, that, having seen what a difference there is, they may rejoice the more in the path of light, and may feel compassion for the darkness of their neighbours; but to wish to exalt their glimmer above our own light is intolerable, and an insult to God and to our souls. "Of what advantage is it," says Isidor,37 "to be learned in human doctrine, and know nothing of divine? to follow perishable inventions, and despise heavenly mysteries? If we love the Scriptures we must avoid those books that outwardly are eloquent and well written, but inwardly lack wisdom." What a condemnation of such books! They are husks without kernels. Such was also the opinion of Philip Melanchthon: "What do the best philosophers teach but self-confidence and self-love? Cicero in his De Finibus estimates each kind of virtue with reference to self-love. How much pride and haughtiness
there is in Plato! It seems to me that a self-sufficient character must inevitably imbibe faulty instincts from the ambition that pervades his writings. The teaching of Aristotle is nothing but one long struggle to prove himself worthy of a good place among the writers on practical philosophy" (System of Theology).

18. (ii.) Again it is said: If they do not teach theology rightly, at any rate they teach philosophy, and this cannot be learned from the sacred writings, that have been given us for our salvation. I answer: The Word of God most high is the fountain of wisdom (Ecclesiasticus i. 5). True philosophy is nothing but the true knowledge of God and of His works, and this cannot be learned better than from the mouth of God Himself. For this reason St. Augustine, praising the Holy Scripture, says: "Here is philosophy, since the cause of everything that exists is in the Creator. Here are ethics, since a good and honest life can only be formed if those things are loved which ought to be loved, that is to say, God and our neighbour. Here is logic, since truth, the light of the rational soul, is God Himself. Herein is the salvation of the state; for the state can never be well guarded, or rest on a foundation of confidence and peace, unless the common good be loved, and this, in its highest and truest sense, is God." Recently, too, it has been pointed out by many that the foundations of all the sciences and philosophic arts are contained in Scripture, and more truly than elsewhere, so that the part played by the Holy Spirit in our education is indeed wonderful. For, though its first object is to instruct us in things invisible and eternal, it nevertheless unfolds the laws of nature and of art at the same time, teaching us how to reason wisely on all subjects and how to apply our reason in a practical manner. Yet of all this there is but a trace in the works of the pagan philosophers. A writer on theology has said that the marvellous wisdom of Solomon consisted in bringing the law of God into the families, the schools, and the public places, and there is no reason why the wisdom of Solomon, that
is to say, true and heavenly wisdom, should not once more be ours, if we give our children the Word of God instead of pagan books, and thus supply them with counsels for all the chances of life. Our object, therefore, should be to have in our homes that which can make us wise, even in that external or worldly wisdom that we call philosophy. Those were luckless times when the children of Israel had to go down to the Philistines to polish each man his plough, his mattock or his axe, because there was no smith in the land of the Israelities (1 Sam. xiii. 19, 20). But it is surely not necessary that the resources of the Israelites should always be limited in this way; especially as the arrangement was a bad one, for the following reason: the Philistines supplied the Israelites with harrows, but on no account would they supply them with swords that might be used against themselves. From the pagan philosophers, in the same way, you can get the well-known syllogisms and flowers of speech, but from this source you will find it impossible to procure swords and spears with which to combat impiety and superstition. Let us then hope for the times of David and of Solomon, when the Philistines were laid low but Israel reigned and rejoiced in its good fortune.

19. (iii.) But, for the sake of style, students of Latin should read Terence, Plautus, and similar writers. I answer: Are we to bring our children into ale-houses, cook-shops, taverns, and other dens of iniquity, in order that they may learn how to speak? For, I ask you, is it not into such unclean places that Terence, Plautus, Catullus, Ovid, and the rest of them lead our young? What do they set before them but jesting, feasting, drunkenness, amours, and deceits, from which Christians should avert their eyes and ears, even if they encounter them by chance? Is the natural man not depraved enough, that it is necessary to bring to him and to show to him all manner of wickedness, and, as it were, to seek out opportunities to hurl him to destruction? But it will be said: "The matter in those authors is not all bad." I answer: Evil sticks far more readily than good, and it is therefore a very dangerous
practice to send the young to a spot where good and evil occur in combination. If we wish to poison any one, we do not give him poison alone, but mix it with some pleasant drink, the presence of which does not interfere with the action of the poison. This is precisely the way in which these men-destroyers of old mixed their hellish poisons with cunning inventions and with elegance of style; and are we to remain conscious of their devices and not strike the potion from their hands?

Some one else may object: "They are not all lascivious writers. Cicero, Virgil, Horace, and others are serious and earnest." I answer: None the less they are blind pagans, and turn the minds of their readers from the true God to other gods and goddesses (Jove, Mars, Neptune, Venus, Fortune, etc.), though God has said to His people: "Make no mention of the name of other gods, neither let it be heard out of thy mouth" (Exodus xxiii. 13). Then what a chaos of superstitions, of false opinions, of earthly desires at variance with one another, is to be found in these writers! The spirit with which they fill their readers must be very different from that of Christ. Christ calls us from the world, they plunge us into the world. Christ teaches self-abnegation, they teach self-love. Christ teaches us to be humble, they to be magnanimous. Christ demands meekness, they inculcate self-assertion. Christ bids us be simple as doves, they show us how to turn an argument in a thousand different ways. Christ urges us to modesty, they spend their time in mocking others. Christ loves those who believe easily, they prefer those who are suspicious, argumentative, and obstinate.

To conclude briefly and in the words of the Apostle: "What communion hath light with darkness? and what concord hath Christ with Belial? or what portion hath a believer with an unbeliever?" (2 Cor. vi. 15). Rightly does Erasmus say: "Bees avoid withered flowers; and no book, the contents of which are impure, should be opened." And again: "It is safest to sleep on clover, for it is said that no serpents lurk in it, and on the same
principle we should confine ourselves to those books in which no poison is to be feared."

20. Moreover, what attraction have these pagan authors that is not to be found in our sacred writers? Are they the only people who understand the elegances of style? The most perfect master of language is he who gave it to us, the Holy Spirit. His words are sweeter than honey and more piercing than a two-edged sword; more active than the fire that liquefies metals, and weightier than a hammer which grinds rocks to powder, for they tell us of God. Is it heathen writers alone who relate marvellous events? Our Scriptures are full of events that are truer and far more wonderful. Are they the only authors who can fashion figures of speech, and riddling sayings, or write passages that are forcible and pithy? Our Scriptures are full of such passages. Leprous is his imagination who prefers Abana and Pharpar, rivers of Damascus, to Jordan and the waters of Israel (2 Kings v. 12). Blind is the eye to which Olympus, Helicon, and Parnassus seem more beautiful than Sinai, Sion, Hermon, Tabor, and Olivet. Deaf is the ear to which the lyre of Orpheus, of Homer, or of Virgil sounds sweeter than David's lute. Corrupt is the palate to which Nectar, Ambrosia, and the Castalian springs taste better than celestial Manna and the fountains of Israel. Perverse is the heart that finds more pleasure in the names of the gods, the goddesses, the muses, and the graces than in the adorable names of Jehovah, of Christ the Saviour, and of the Holy Ghost. Blind is the hope that wanders through the Elysian fields in preference to the gardens of Paradise. With them all is romance, a mere shadow of truth, while with us all is reality and the very essence of truth.

21. But it will be said: These writers contain elegances of speech and moral sentiments that are worthy of our adoption. Is not this a sufficient reason for sending our children to them? Should we not spoil the Egyptians and strip them of their raiment? Does not God bid
us do so? (Exodus iii. 22). It is the right of the Church to usurp all the possessions of the heathen. I answer: When Manasseh and Ephraim wished to seize the land of the heathen, the men alone advanced; the women and children stayed behind in safety (Joshua i. 14). We should do the same. Men of wisdom and judgment, steadfast in the faith, should go forward and disarm these pagan writers; the young should not be exposed to danger. What if our youths were killed or wounded or taken prisoner? How many, alas, has pagan philosophy already drawn away from Christ and given over to Atheism! The safest plan, therefore, is to send armed men to deprive those accursed by heaven of their gold, silver, and precious things, and to distribute them among the heirs of God. O that God would stir up some heroic spirit to cull those flowers of elegance from the vast deserts in which they grow, and plant them in the garden of Christian philosophy, that nothing be lacking there.

22. Finally, if any pagan writers are to be countenanced, let them be Seneca, Epictetus, Plato, and similar teachers of virtue and honesty; since in these comparatively little error and superstition are to be found. This was the opinion of the great Erasmus, who advised that the Christian youth be brought up on the Holy Scriptures, but added: "If they have anything to do with profane literature, let it be with those books that approximate most closely to the Scriptures" (Compendium of Theology). But even these books should not be given to the young until their Christian faith is well assured; and in any case careful editions should be issued in which the names of the gods and the general tone of superstition should be removed. For it is on the condition that their heads be shaved and their nails pared, that God allows heathen maidens to be taken to wife (Deut. xxi. 12). Let there be no misunderstanding. We do not absolutely prohibit Christians from reading heathen writings, since to those who believe Christ has given the power of taking up serpents, and drinking deadly things with impunity (Mark xvi. 18); but the sons
of God, whose faith is yet weak, should not be exposed to these serpents, and to give them the opportunity of drinking such poison would indeed be rash. Great caution should therefore be used, and this is what we urge. The Spirit of Christ has said that the children of God should be nourished by the spiritual milk that is without guile (1 Peter ii. 2; 2 Tim. iii. 15).

23. But those who thus incautiously aid the cause of Satan and oppose that of Christ have yet another argument. "The Holy Scriptures," they say, "are too hard for the young, and therefore some other books must be given them to read until their judgment is mature."

I answer: This is the language of those who err and know not the Scriptures nor the power of God, as I will show in three ways: firstly, there is a well-known story told of Timotheus the celebrated musician, that whenever he took a fresh pupil he asked him if he had already learned the rudiments with another master. If he answered in the negative he took him at a moderate price; if in the affirmative he charged twice as much. For he said that those who had already learned give him twice as much trouble, as he had first to cure them of their bad habits, and then to teach them the right way to play. Now, our master, and that of the human race, is Jesus Christ, and we are forbidden to go to any other (Matt. xvii. 5, and xxiii. 8). He it was who said: "Suffer the little children to come unto me, and forbid them not" (Mark x. 14), and shall we, contrary to His will, lead them elsewhere? Are we afraid that Christ's task will be too light, and that He will teach them His ways too easily? And are we therefore to take them through the cook-shops and taverns, and give them to Christ to reform when thoroughly corrupt? This is a terrible proposal for the unhappy and innocent boys; for either they will have to spend their whole lives in laboriously getting rid of the habits they have acquired, or they will be altogether rejected by Christ, and given over to the tuition of Satan. Is not that which has been consecrated to Moloch an abomination to God? Let the
Christian magistrates and the heads of the Churches—by God's mercy I implore it—take steps to prevent Christian boys, born in Christ and consecrated through baptism, from being offered up to Moloch.

24. The cry that the Scriptures are too difficult to be understood by children, is altogether false. Does God not know how to suit His Word to our understanding? (Deut. xxxi. 11, 12, 13). Does not David say that the law of the Lord gives wisdom to little ones (N.B. to little ones)? Does not Peter say that the Word of God is milk for the newborn babes of God, given to them that they may grow thereby unto salvation (1 Peter ii. 2)? The Word of God, therefore, is the sweetest and best milk for the newborn children of God. Why oppose God on this point? Especially since pagan learning needs teeth to masticate it; yes, and often breaks them. Therefore the Holy Spirit, through David, invites the little ones into His school: "Come, ye children, hearken unto me; I will teach you the fear of the Lord" (Psalm xxxiv. 11).

25. Lastly, that the Scriptures contain passages of great profundity is perfectly true; but they are of such a kind that, while elephants sink to the bottom, lambs can swim with ease in them, to quote the words of St. Augustine when he wished to lay stress on the difference between the wise of the world who rush into Scriptural criticism presumptuously and Christ's little ones who approach God's Word in a humble and meek spirit. Besides, what need is there to begin with difficult passages? We can proceed step by step. First, we should embark upon the Catechism, and then keep in shallow water by teaching Scripture history, moral sentences, and the like, that can be easily understood, but which at the same time lead to the weightier matters that follow. And finally, when our pupils are fit for it, we can introduce them to the mysteries of the Faith. Thus, knowing the sacred writings from their infancy, they will be the more easily preserved from worldly corruption, and will be made wise unto salvation through faith which is in Christ Jesus (2 Tim. iii. 15). For, if a
man give himself up to God, sit at the feet of Christ, and listen to the wisdom that comes from on high, it is impossible that the Spirit of Grace should not fill him, kindle within him the light of true reason, and point out the true path of salvation.

26. I pass over the fact that those authors who are placed before Christian boys instead of the Bible (Terence, Cicero, Virgil, etc.), possess the very defects that are attributed to the Scriptures, since they are difficult and not suited to the young. It was not for boys that they wrote, but for men of mature judgment, accustomed to the theatre and the law-courts, and it therefore goes without saying that they can be of no advantage to any one else. One thing at any rate is certain, that he who has reached man's estate will derive more profit from reading Cicero once than if he had learned his entire works off by heart when a boy, and that such studies should therefore be deferred to a suitable season, and then only approached by those to whom they will be of use, if indeed they are of use to any one.

Of far greater importance is the point that has already been mentioned, namely, that the task of Christian schools is to form citizens, not for the world, but for heaven, and that they should accordingly be supplied with masters who are better acquainted with heavenly than with earthly things.

27. Let us conclude, therefore, with the angelic words: “In the place wherein the highest beginneth to show his city, there can no man's building be able to stand” (2 Esdras x. 54). As God wishes us to be trees of righteousness, the planting of the Lord, that He may be glorified (Isaiah lxi. 3), we should not allow our children to be shrubs in the plantation of Aristotle, or of Plato, or of Plautus, or of Cicero, or of any author whose works they may chance to read: “Every plant, which my heavenly Father planted not, shall be rooted up” (Matt. xv. 13); “Tremble therefore, ye who cease not to murmur, and to exalt yourselves against the knowledge of God” (2 Cor. x. 5).
CHAPTER XXVI
OF SCHOOL DISCIPLINE

1. There is a proverb in Bohemia, "A school without discipline is like a mill without water," and this is very true. For, if you withdraw the water from a mill, it stops, and, in the same way, if you deprive a school of discipline, you take away from it its motive power. A field also, if it be never ploughed, produces nothing but weeds; and trees, if not continually pruned, revert to their wild state and bear no fruit. It must not be thought, however, that we wish our schools to resound with shrieks and with blows. What we demand is vigilance and attention on the part of the master and of the pupils. For discipline is nothing but an unfailing method by which we may make our scholars, scholars in reality.

2. As regards discipline, therefore, it is advisable that the educator of youth know its object, its subject-matter, and the various forms which it may assume, since he will then know why, when, and how, systematised severity is to be used.

3. We may start with the incontestable proposition that punishment should be employed towards those who err. But it is not because they have erred that they should be punished (for what has been done cannot be undone), but in order that they may not err again in the future. Discipline should therefore be free from personal elements, such as anger or dislike, and should be exercised with such frankness and sincerity of purpose, that even the pupils
may feel that the action taken is for their good, and that those set over them are but exercising paternal authority. They will thus regard it in the same light as a bitter draught prescribed for them by the doctor.

4. Now no discipline of a severe kind should be exercised in connection with studies or literary exercises, but only where questions of morality are at stake. For, as we have already shown, studies, if they are properly organised, form in themselves a sufficient attraction, and entice all (with the exception of monstrosities) by their inherent pleasantness. If this be not the case, the fault lies, not with the pupil, but with the master, and, if our skill is unable to make an impression on the understanding, our blows will have no effect. Indeed, by any application of force we are far more likely to produce a distaste for letters than a love for them. Whenever, therefore, we see that a mind is diseased and dislikes study, we should try to remove its indisposition by gentle remedies, but should on no account employ violent ones. The very sun in the heavens gives us a lesson on this point. In early spring, when plants are young and tender, he does not scorch them, but warms and invigorates them by slow degrees, not putting forth his full heat until they are full-grown and bring forth fruit and seeds. The gardener proceeds on the same principle, and does not apply the pruning-knife to plants that are immature. In the same way a musician does not strike his lyre a blow with his fist or with a stick, nor does he throw it against the wall, because it produces a discordant sound; but, setting to work on scientific principles, he tunes it and gets it into order. Just such a skilful and sympathetic treatment is necessary to instil a love of learning into the minds of our pupils, and any other procedure will only convert their idleness into antipathy and their lack of interest into downright stupidity.

5. If, however, some stimulus be found necessary, better means than blows can be found. Sometimes a few severe words or a reprimand before the whole class is very efficacious, while sometimes a little praise bestowed on the others
OF SCHOOL DISCIPLINE

has great effect. "See how well so-and-so attends! See how quickly he sees each point! While you sit there like a stone!" It is often of use to laugh at the backward ones. "You silly fellow, can't you understand such a simple matter?" Weekly, or at any rate monthly, contests for the first place in class may also be introduced, as we have shown elsewhere. Great care, however, should be taken that these experiments do not degenerate into a mere amusement, and thus lose their force; since, if they are to act as a stimulus to industry, they must be backed on the part of the pupil by a love of praise and a dislike of blame or of losing his place in class. It is therefore absolutely essential that the master be always in the room, that he throw a good deal of energy into his work, and that he scold the idlers and praise the hard-working boys before the whole class.

6. Only in the case of moral delinquencies may a severer discipline be used: (1) as, for instance, in the case of impiety of any kind, such as blasphemy, obscenity, or any other open offence against God's law. (2) In the case of stubbornness and premeditated misbehaviour, such as disobeying the master's orders, or the conscious neglect of duty. (3) In the case of pride and disdain, or even of envy and idleness; as, for example, if a boy refuse to give a schoolfellow assistance when asked to do so.

7. For offences of the first kind are an insult to God's majesty. Those of the second kind undermine the foundation of all virtue, namely, humility and obedience. While those of the third kind prevent any rapid progress in studies. An offence against God is a crime, and should be expiated by an extremely severe punishment. An offence against man is iniquitous, and such a tendency should be promptly and sternly corrected. But an offence against Priscian is a stain that may be wiped out by the sponge of blame. In a word, the object of discipline should be to stir us up to revere God, to assist our neighbours, and to perform the labours and duties of life with alacrity.

8. The sun in the heavens teaches us the best form of
discipline, since to all things that grow it ministers (1) light and heat, continuously; (2) rain and wind, frequently; (3) lightning and thunder, but seldom; although these latter are not wholly without their use.

9. It is by imitating this that the master should try to keep his pupils up to their work.

(1) He should give them frequent examples of the conduct that they should try to imitate, and should point to himself as a living example. Unless he does this, all his work will be in vain.

(2) He may employ advice, exhortation, and sometimes blame, but should take great care to make his motive clear and to show unmistakably that his actions are based on paternal affection, and are destined to build up the characters of his pupils and not to crush them. Unless the pupil understands this and is fully persuaded of it, he will despise all discipline and will deliberately resist it.

(3) Finally, if some characters are unaffected by gentle methods, recourse must be had to more violent ones, and every means should be tried before any pupil is pronounced impossible to teach. Without doubt there are many to whom the proverb, "Beating is the only thing that improves a Phrygian," applies with great force. And it is certain that, even if such measures do not produce any great effect on the boy who is punished, they act as a great stimulus to the others by inspiring them with fear. We should take great care, however, not to use these extreme measures too readily, or too zealously, as, if we do, we may exhaust all our resources before the extreme case of insubordination which they were intended to meet, arises.

10. In short, the object of discipline should be to confirm those who are being trained up for God and for the Church, in that disposition which God demands in His sons, the pupils in the school of Christ, so that they may rejoice with trembling (Psalm ii. 11), and looking to their own salvation may rejoice always in the Lord (Phil. ii. 4 and 10), that is to say, that they may love and reverence their
masters, and not merely allow themselves to be led in the right direction, but actually tend towards it of their own accord.

This training of the character can only be accomplished in the above-mentioned ways: by good example, by gentle words, and by continually taking a sincere and undisguised interest in the pupil. Sudden bursts of anger should only be used in exceptional circumstances, and then with the intention that renewed good feeling shall be the result.

11. For (to give one more example) did any one ever see a goldsmith produce a work of art by the use of the hammer alone? Never. It is easier to cast such things than to beat them out, and, if any excrescence have to be removed, it is not by violent blows that the artificer gets rid of it, but by a series of gentle taps, or by means of a file or a pair of forceps; while he completes the operation by polishing and smoothing his work. And do we believe that irrational force will enable us to produce intelligent beings, images of the living God?

12. A fisherman, too, who catches fish in deep waters with a drag-net, not only fastens on pieces of lead to sink it, but also attaches corks to the other end of it, that it may rise to the surface of the water. In the same way whoever wishes to ensnare the young in the nets of virtue, must, on the one hand, humble and abase them by severity, and, on the other, exalt them by gentleness and affection. Happy are the masters who can combine these two extremes! Happy are the boys who find such masters!

13. Here we may quote the opinion which that great man, Eilhard Lubinus, doctor of theology, has expressed on the reform of schools in the preface to his edition of the New Testament in Greek, Latin, and German—

"The second point is this: the young should never be compelled to do anything, but their tasks should be of such a kind and should be set them in such a way that they will do them of their own accord, and take pleasure in them. I am therefore of opinion that rods and blows,
those weapons of slavery, are quite unsuitable to freemen, and should never be used in schools, but should be reserved for boys of an abnormal and servile disposition. Such boys are easily recognised and must be removed from the school at once, on account both of the sluggishness of their disposition and of the depravity that is generally found in conjunction with it. Besides, any knowledge that they may acquire will be employed for wicked purposes, and will be like a sword in the hands of a madman. There are, however, other kinds of punishment suitable for boys who are free-born and of normal disposition, and these we may employ.”
CHAPTER XXVII

OF THE FOURFOLD DIVISION OF SCHOOLS, BASED ON AGE AND ACQUIREMENTS

1. Artisans are accustomed to fix certain limits of time for the training of an apprentice (two, three, or seven years), according to the case or difficulty of the trade. Within these limits a complete training can be had, and those apprentices who have completed the course become, first, journeymen, and then master-workmen. The same system must be adopted in school organisation, and distinct periods of time must be mapped out for the acquirement of arts, sciences, and languages respectively. In this way we may cover the whole range of human knowledge within a certain number of years, and may possess true learning, true morality, and true piety by the time we leave the forging-places of humanity.

2. In order that this goal may be reached, the whole period of youth must be devoted to the cultivation of the intellect (and by this we do not mean that one art only, but that all the liberal arts and all the sciences should be acquired). The process should begin in infancy and should continue until the age of manhood is reached; and this space of twenty-four years should be divided into well-defined periods. In this we must follow the lead of nature. For experience shows that a man's body continues to grow up to his twenty-fifth year, and that after this it only increases in strength; and we must conclude that this slow rate of increase has been accorded to man
by the forethought of God (for the larger bodies of animals attain their full growth in a few months, or in a couple of years at most) that he may have the more time to prepare himself for the duties of life.

3. The whole period, therefore, must be divided into four distinct grades: infancy, childhood, boyhood, and youth, and to each grade six years and a special school should be assigned.

I. For infancy the mother's knee.
II. For childhood the Vernacular-School.
III. For boyhood The Latin-School or Gymnasium.
IV. For youth The University and travel.

A Mother-School should exist in every house, a Vernacular School in every hamlet and village, a Gymnasium in every city, and a University in every kingdom or in every province.

4. These different schools are not to deal with different subjects, but should treat the same subjects in different ways, giving instruction in all that can produce true men, true Christians, and true scholars; throughout graduating the instruction to the age of the pupil and the knowledge that he already possesses. For, according to the laws of this natural method, the various branches of study should not be separated, but should be taught simultaneously, just as the various parts of a tree increase together at every period of its growth.

5. The difference between these schools is threefold. Firstly, in the earlier schools everything is taught in a general and undefined manner, while in those that follow the information is particularised and exact; just as a tree puts forth more branches and shoots each successive year, and grows stronger and more fruitful.

6. Secondly, in the Mother-School the external senses should be exercised and taught to distinguish the objects that surround them. In the Vernacular-School, the internal senses, the imagination and the memory, in combination with their cognate organs, should be trained, and this
OF THE FOURFOLD DIVISION OF SCHOOLS 257

by reading, writing, painting, singing, counting, measuring, weighing, and committing various things to memory. In the Latin-School the pupil should be trained to understand and pass judgment on the information collected by the senses, and this by means of dialectic, grammar, rhetoric, and the other sciences and arts that are based on principles of causation. Finally, to the University belong those subjects that have special relation to the will, namely, the faculties, of which theology teaches us to restore harmony to the soul; philosophy, to the mind; medicine, to the vital functions of the body; and jurisprudence, to our external affairs.

7. Our faculties are best developed in the following manner. The objects should first be placed before the organs of sense on which they act. Then the internal senses should acquire the habit of expressing in their turn the images that result from the external sensation, both internally by means of the faculty of recollection, and externally with the hand and tongue. At this stage the mind can begin to operate, and, by the processes of exact thought, can compare and estimate all objects of knowledge. In this way an acquaintance with nature and a sound judgment may be obtained. Last of all, the will (which is the guiding principle in man) makes its power felt in all directions. To attempt to cultivate the will before the intellect (or the intellect before the imagination, or the imagination before the faculty of sense perception) is mere waste of time. But this is what those do who teach boys logic, poetry, rhetoric, and ethics before they are thoroughly acquainted with the objects that surround them. It would be equally sensible to teach boys of two years old to dance, though they can scarcely walk. Let our maxim be to follow the lead of nature in all things, to observe how the faculties develop one after the other, and to base our method on this principle of succession.

8. A third difference between the schools is this. The Mother-School and the Vernacular-School embrace all the young of both sexes. The Latin-School gives a more
thorough education to those who aspire higher than the workshop; while the University trains up the teachers and learned men of the future, that our churches, schools, and states may never lack suitable leaders.

9. These four classes of schools may be compared to the four seasons of the year. The Mother-School recalls the gentle spring, filled with the varied scent of flowers. The Vernacular-School represents the summer that spreads before our eyes its full ears and early fruit. The Latin-School corresponds to autumn, for here the fruit in the fields and vineyards is collected and stored away in the granaries of our mind. And last of all, the University may be compared to the winter, when we prepare for various uses the fruit already collected, that we may have sufficient to sustain us for the rest of our lives.

10. Our method of education may also be compared to the various stages in the growth of a tree. The boys who are six years of age and are tenderly cared for by their parents are like shoots that have been carefully planted, have taken root, and are beginning to put forth buds. At twelve years of age they are like a young tree that is covered with branches and buds, though it is as yet uncertain how these will develope. At eighteen years of age, youths well instructed in languages and arts are like trees covered with blossoms that are pleasant to see and to smell, and at the same time give promise of fruit. And finally, at twenty-four or twenty-five years of age, young men, who have been thoroughly educated at a university, resemble a tree covered with fruit that can be plucked and used when it is required.

But we must now examine the several stages in detail.
CHAPTER XXVIII

SKETCH OF THE MOTHER-SCHOOL

1. It is when it first comes into being that a tree puts forth the shoots that are later on to be its principal branches, and it is in this first school that we must plant in a man the seeds of all the knowledge with which we wish him to be equipped in his journey through life. A brief survey of the whole of knowledge will show the possibility of this, and this survey can easily be made if we bring everything under twenty headings.

2. (i.) Metaphysic (as it is called) should certainly be our starting-point, since the first conceptions that children have are general and confused. They see, hear, taste, and touch, but are ignorant of the exact object of their sensations. They commence, therefore, by learning the general concepts: something, nothing, it is, it is not, thus, otherwise, where, when, like, unlike, etc., and these are nothing but the prime concepts of metaphysic.

3. (ii.) In physics, a boy, during the first six years of his life, can be brought to know what are water, earth, air, fire, rain, snow, frost, stone, iron, trees, grass, birds, fishes, oxen, etc. He may also learn the names and uses of the members of his body, or at any rate of the external ones. At this age these things are easily learned, and pave the way for natural science.

4. (iii.) A boy learns the elements of optics when he begins to distinguish and to call by their names light, darkness, and shade, and to know the difference between the principal colours, white, black, red, etc.
5. (iv.) The rudiments of astronomy will consist in knowing what is meant by the heavens, the sun, the moon, and the stars, and in watching their rising and their setting daily.

6. (v.) We know the elements of geography when we learn the nature of mountains, valleys, plains, rivers, villages, citadels, or states, according to the situation of the place in which we are brought up.

7. (vi.) The basis of chronology is laid, if the boy understand what is meant by an hour, a day, a week, or a year; or what summer and winter are; or the signification of the terms "yesterday," "the day before yesterday," "tomorrow," "the day after to-morrow," etc.

8. (vii.) The commencement of history consists in recollecting and reporting what has recently happened, or how this or that person has carried out this or that matter; though this exercise should only relate to some incident in the child's life.

9. (viii.) The seeds of arithmetic will be planted if the child understand what is meant by "much" and "little," can count up to ten, can see that three are more than two, and that one added to three makes four.

10. (ix.) He will possess the elements of geometry if he know what we mean by "large" and "small," "long" and "short," "broad" and "narrow," "thick" and "thin"; what we signify by a line, a cross, or a circle, and how we measure objects in feet and yards.

11. (x.) The elements of statics will have been learned if the children see objects weighed in scales, or acquire the power of telling the approximate weight of objects by weighing them in their hands.

12. (xi.) They will receive a training in mechanics if they are permitted or are actually taught to employ their hands continually; for instance, to move something from one place to another, to arrange something else in one way or another, to construct something, or to pull something to pieces, to make knots or to undo them, and so forth; the very things that children of this age love to do. As these
actions are nothing but the efforts of an active mind to realise itself in mechanical production, they should not be hindered, but rather encouraged and skilfully guided.

13. (xii.) The elements of the process of reasoning, namely dialectic, are learned when the child observes that conversations are carried on by means of question and answer, and himself acquires the habit of asking and answering questions. He should, however, be taught to ask sensible questions and to give direct answers, and also not to wander from the point at issue.

14. (xiii.) The grammar of childhood consists in learning to speak the mother-tongue correctly, that is to say, in pronouncing with distinctness the letters, syllables, and words.

15. (xiv.) The beginnings of rhetoric consist in imitating the figures of speech that occur in family conversation, but more especially in the appropriate use of gesture, and in inflecting the voice so as to suit the words; that is to say, the voice should be raised on the last syllables of words, in asking questions, and lowered in answering them. This and similar points are acquired naturally, but a little instruction is of great assistance if any mistakes are made.

16. (xv.) Children may get some notion of poetry by learning a number of verses off by heart, for preference those that contain some moral sentiment.

17. (xvi.) They will take their first steps in music by learning easy hymns and psalms. This exercise should form part of their daily devotions.

18. (xvii.) The rudiments of economics are acquired when the child learns the names of the various members of a family, that is to say, what is meant by the terms father, mother, maid-servant, man-servant, etc.; or the various parts of a house, as hall, kitchen, bedroom, stable; or the names of domestic utensils, as table, plate, knife, broom, etc.

19. (xviii.) It is not so easy to give a foretaste of politics, as at this age the understanding is only sufficiently
developed to take in household affairs. Some attempt, however, may be made. It may be pointed out, for instance, that, in a state, some men meet together in a council-chamber and are called councillors, and that of these some are called members, others ministers, others lawyers, and so forth.

20. (xix.) But it is of morals (ethics), in particular, that the foundations should be solidly laid, for to a well-educated youth we wish the practice of virtue to be second nature. For instance,

(1) Temperance should be practised by never over-filling the stomach, and by never taking more food than is necessary to appease hunger and thirst.

(2) Cleanliness should be practised at meals, and in the treatment of clothes, dolls, and toys.

(3) Reverence should be shown by the child to his superiors.

(4) Obedience to both commands and prohibitions should always be willing and prompt.

(5) Truth should always be religiously observed. Falsehood and deceit should never be permitted, whether in jest or in earnest (for jests of this kind may degenerate into a serious evil).

(6) They will learn justice if they never touch, take, keep, or hide anything that belongs to any one else, if they annoy no one, and envy no one.

(7) It is of greater importance that they learn to practise charity, so that they may be ready to give alms to those whom need compels to ask for them. For love is the especial virtue of Christians. Christ bids us practise it; and, now that the world is growing aged and cold, it is greatly to the interest of the Church to kindle in men's hearts the flame of love.

(8) Children should also be taught to occupy themselves continually, either with work or with play, so that idleness may become intolerable to them.

(9) They should be taught to speak but little and to refrain from saying all that rises to their lips, nay, even to
maintain absolute silence when the occasion demands it; that is to say, when others are speaking, when any distinguished person is present, and when the circumstances demand silence.

(10) It is also important that they learn patience in infancy, since this will be of use to them throughout their whole lives. In this way the passions may be subdued before they acquire strength, while reason, and not impulse, will gain the upper hand.

(11) Politeness and readiness to help others is a great ornament of youth, and, indeed, of every age. This also should be learned in the first six years, that our youths may lose no opportunity of rendering services to those whom they meet.

(12) Nor must we omit to train them in good manners, that they may do nothing stupidly or boorishly. To this end they should learn the manners of polite society; such as how to shake hands, how to make a modest request when they want anything, and how to bend the knee and kiss the hand gracefully when returning thanks for a kindness.

21. (xx.) Finally, by the time they are six years old, boys should have made considerable progress in religion and piety; that is to say, they should have learned the heads of the Catechism and the principles of Christianity, and should understand these and live up to them as far as their age permits. Thus, by realising that the Deity is ever present, by seeing God around them, and by fearing Him as the just avenger of the wicked, they will be prevented from committing any sinful act; while by loving, reverencing, and praising in Him the just recompenser of the righteous, and by seeking for His compassion in life and in death, they will be led to omit no righteous act that they think may please Him, will acquire the habit of living as if they were in God's presence, and (as the Scripture saith) will walk with God.

22. We shall thus be able to apply to Christian children the words that the Evangelist uses of Christ Himself:
"He advanced in wisdom and stature, and in favour with God and men" (Luke ii. 52).

23. We have now described the limits and the tasks of the Mother-School. It is impossible to give a more detailed account, or a time-table stating how much work should be done in each year, month, and day (as is both possible and desirable in the Vernacular-School and in the Latin-School), for two reasons: firstly, because it is not possible for parents, who have their household duties to occupy them, to proceed as methodically as a schoolmaster can, whose sole occupation is to instruct youth; secondly, because, in respect of intellect and teachableness, some children develop much sooner than others. Some children of two years old can speak with ease, and display great intelligence, while others are scarcely equal to them when five years old. With this early education, therefore, all detail must be left to the prudence of the parent.

24. Assistance, however, may be given in two ways. In the first place, a hand-book should be written for parents and nurses, that they may have their duties in black and white before their eyes. This hand-book should contain a brief description of the various subjects in which the children should be educated, and should state the occasions that are most suitable for each, and with what words and what gestures it is best to instil them. Such a book with the title, "Informatory of the Mother-School," has still to be written by me.

25. The other aid to study in the Mother-School is a picture-book which should be put straight into the child's hands. At this age instruction should mainly be carried on through the medium of sense-perception, and, as sight is the chiefest of the senses, our object will be attained if we give the children pictures of the most important objects in physics, optics, astronomy, geometry, etc., and these may be arranged in the order of the subjects of knowledge that we have just sketched. In this book should be depicted mountains, valleys, trees, birds, fishes, horses, oxen, sheep, and men of varied age and height. Light and darkness
also should be represented, as well as the heavens with the sun, moon, stars, and clouds, while to these the principal colours should be added. Articles connected with the house and the workshop, such as pots, plates, hammers, pincers, etc., should not be omitted. State functionaries should be represented; the king with his sceptre and crown, the soldier with his arms, the husbandman with his plough, the waggoner with his waggon, and the post-cart going at full speed; while over each picture should be written the name of the object that it represents, as "house," "ox," "dog," "tree," etc.

26. This picture-book will be of use in three ways: (1) It will assist objects to make an impression on the mind, as we have already pointed out. (2) It will accustom the little ones to the idea that pleasure is to be derived from books. (3) It will aid them in learning to read. For, since the name of each object is written above the picture that represents it, the first steps in reading may thus be made.
CHAPTER XXIX

SKETCH OF THE VERNACULAR-SCHOOL

1. In chap. ix. I demonstrated that all the young of both sexes should be sent to the public schools, I now add that they should first be sent to the Vernacular-School. Some writers hold the contrary opinion. Zepper {Pol. bk. i. ch. 7) and Alsted (Scholastic, ch. 6) would persuade us that only those boys and girls who are destined for manual labour should be sent to the Vernacular-School, while boys whose parents wish them to receive a higher education should be sent straight to the Latin-School. Moreover, Alsted adds: “Some will doubtless disagree with me, but the system that I propose is the one which I would wish adopted by those whose educational interests I have most at heart.” From this view my whole didactic system forces me to dissent.

2. (i.) The education that I propose includes all that is proper for a man, and is one in which all men who are born into this world should share. All therefore, as far as is possible, should be educated together, that they may stimulate and urge on one another.

(ii.) We wish all men to be trained in all the virtues, especially in modesty, sociability, and politeness, and it is therefore undesirable to create class distinctions at such an early age, or to give some children the opportunity of considering their own lot with satisfaction and that of others with scorn.

(iii.) When boys are only six years old, it is too early to
determine their vocation in life, or whether they are more suited for learning or for manual labour. At this age, neither the mind nor the inclinations are sufficiently developed, while, later on, it will be easy to form a sound opinion on both. In the same way, while plants are quite small, a gardener cannot tell which to hoe up and which to leave, but has to wait until they are more advanced. Nor should admission to the Latin-School be reserved for the sons of rich men, nobles, and magistrates, as if these were the only boys who would ever be able to fill similar positions. The wind blows where it will, and does not always begin to blow at a fixed time.

3. (iv.) The next reason is that my universal method has not as its sole object the Latin language, that nymph on whom such unbounded admiration is generally wasted, but seeks a way by which each modern language may be taught as well (that every spirit may praise the Lord more and more). This design should not be frustrated by the complete and arbitrary omission of the Vernacular-School.

4. (v.) To attempt to teach a foreign language before the mother-tongue has been learned is as irrational as to teach a boy to ride before he can walk. To proceed step by step is of great importance, as we have seen in chap. xvi. Principle 4. Cicero declared that he could not teach elocution to those who were unable to speak, and, in the same way, my method confesses its inability to teach Latin to those who are ignorant of their mother-tongue, since the one paves the way for the other.

5. (vi.) Finally, what I have in view is an education in the objects that surround us, and a brief survey of this education can be best obtained from books written in the mother-tongue, which embody a list of the things that exist in the external world. This preliminary survey will render the acquisition of Latin far easier, for it will only be necessary to adapt a new nomenclature to objects that are already known; while to the knowledge of actual facts may be added by degrees that of the causes which underlie those facts.

6. Proceeding, therefore, on the basis of my fourfold
division of schools, we may define the Vernacular-School as follows. The aim and object of the Vernacular-School should be to teach to all the young, between the ages of six and twelve, such things as will be of use to them throughout their whole lives. That is to say:

(i.) To read with ease both print and writing in their mother-tongue.

(ii.) To write, first with accuracy, then with speed, and finally with confidence, in accordance with the grammatical rules of the mother-tongue. These rules should be written in a popular form, and the boys should be exercised in them.

(iii.) To count, with ciphers and with counters, as far as is necessary for practical purposes.

(iv.) To measure spaces, such as length, breadth, and distance, with skill.

(v.) To sing well-known melodies, and, in the case of those who display especial aptitude, to learn the elements of advanced music.

(vi.) To learn by heart the greater number of the psalms and hymns that are used in the country. For, if brought up in the praise of God, they will be able (as the Apostle says) to exhort one another with psalms and hymns and spiritual songs, singing to God from their hearts.

(vii.) Besides the Catechism they should know the most important stories and verses in the Bible, and should be able to repeat them word for word.

(viii.) They should learn the principles of morality, which should be drawn up in the shape of rules and accompanied by illustrations suitable to the age and understanding of the pupils. They should also begin to put these principles into practice.

(ix.) They should learn as much economics and politics as is necessary to enable them to understand what they see daily at home and in the state.

(x.) They should also learn the general history of the world; its creation, its fall, its redemption, and its preservation by God up to the present day.
In addition, they should learn the most important facts of cosmography, such as the spherical shape of the heavens, the globular shape of the earth suspended in their midst, the tides of the ocean, the shapes of seas, the courses of rivers, the principal divisions of the earth, and the chief kingdoms of Europe; but, in particular, the cities, mountains, rivers, and other remarkable features of their own country.

Finally, they should learn the most important principles of the mechanical arts, both that they may not be too ignorant of what goes on in the world around them, and that any special inclination towards things of this kind may assert itself with greater ease later on.

7. If all these subjects have been skilfully handled in the Vernacular-School, the result will be that those youths who begin the study of Latin or who enter on agriculture, trade, or professional life will encounter nothing which is absolutely new to them; while the details of their trades, the words that they hear in church, and the information that they acquire from books, will be to them nothing but the more detailed exposition or the more particular application of facts with which they are already acquainted. They will thus find themselves all the fitter to use their understanding, their powers of action, and their judgment.

8. To attain this result we employ the following means:—

(i.) All the children in the Vernacular-School, who are destined to spend six years there, should be divided into six classes, each of which, if possible, should have a class-room to itself, that it may not hinder the others.

(ii.) Specially prepared books should be supplied to each class, and these should contain the whole subject-matter of the literary, moral, and religious instruction prescribed for the class. Within these limits no other books should be needed, and, by their aid, the desired result should infallibly be obtained. They should embody a complete grammar of the mother-tongue, in which should be comprised the names of all the objects that children of
this age can understand, as well as a selection of the most common phrases in use.

9. These class-books should be six in number, corresponding to the number of the classes, and should differ, not in their subject-matter, but in their way of presenting it. Each should embrace all the above-mentioned subjects; but the earlier ones should treat of them in a general manner, choosing their better known and easier features; while those which come later should draw attention to the less known and more complex details, or should point out some fresh way of treating the subject, and thus excite interest and attention. The truth of this will soon be evident.

10. Care must be taken to suit all these books to the children for whom they are intended; for children like whimsicality and humour, and detest pedantry and severity. Instruction, therefore, should ever be combined with amusement, that they may take pleasure in learning serious things which will be of genuine use to them later on, and that their dispositions may be, as it were, perpetually enticed to develop in the manner desired.

11. The titles of these books should be of such a kind as to please and attract the young, and should at the same time express the nature of their contents. Suitable names might be borrowed from the nomenclature of a garden, that sweetest possession of youth. Thus, if the whole school be compared to a garden, the book of the lowest class might be called the violet-bed, that of the second class the rose-bed, that of the third the grass-plot, and so on.

12. Of the matter and form of these books I will speak in greater detail elsewhere. I will only add that, as they are written in the mother-tongue, the technical terms of the arts should also be expressed in the vernacular, and not in Latin or Greek. For (1) we wish the young to make progress with as little delay as possible. Now foreign terms must necessarily be explained before they are understood, and, even when explained, are not properly understood, but are thought to have no meaning apart from
their technical signification. In addition, they are difficult to remember. On the other hand, if the vernacular terms are used, it is only necessary to point out the object designated by each term. In this way we wish to remove all delays and difficulties from the path of this elementary instruction. (2) Besides this, we wish to cultivate and improve the vernacular languages, and this is to be done, not by imitating the French, who incorporate Greek and Latin words that the people cannot understand (for which practice Stevin blames them), but by expressing our meaning in terms which can be understood by everybody. Stevin gave the same advice to the Belgians (Geog. bk. i.), and carried it into effect in his work on mathematics.

13. But it may be objected that all languages are not rich enough to supply suitable equivalents for Greek and Latin terms; that even if this were done, the learned would not relinquish their use; and, lastly, that those boys who are going to learn Latin had better begin at this stage, and so avoid the necessity of learning fresh technical terms later on.

14. I reply: If any language be obscure, or insufficient to express necessary ideas, this is the fault, not of the language, but of those who use it. The Romans and Greeks had originally to form the words that are now in use, and these words seemed so obscure and so rude that their authors were uncertain if they could ever serve as a vehicle for thought. But now that they are universally accepted they prove sufficiently expressive. As an illustration of what I mean, take the terms "essence," "substance," "accident," "quality," "quantity," etc. No language, therefore, need lack words unless men lack industry.

15. As for the second objection; let the learned retain their own terms. We are now seeking a way by which the common people may be led to understand and take an interest in the liberal arts and sciences; and with this end in view we must not speak in a language that is foreign to them, and that is in itself artificial.
16. And lastly, those boys who have to learn Latin later on will find it no disadvantage to know the technical terms in their mother-tongue, nor will it prove any hindrance to them that they praised God in their own language before doing so in Latin.

17. The third requisite is an easy method of introducing these books to the young, and of this we will give a brief sketch in the following rules:

(i.) The class lessons should not exceed four daily, of which two should be before mid-day, and two after. The remaining hours of the day may profitably be spent in domestic work (especially among the poor), or in some form of recreation.

(ii.) The morning should be devoted to the exercise of the intellect and the memory, the afternoon to that of the hand and the voice.

(iii.) In the morning the master shall read over the lesson for the hour several times, while the whole class attends, and shall explain anything that needs explanation in simple language, and in such a way that it cannot but be understood. He shall then bid the boys read it in turn, and while one reads it in a clear voice the rest should attend and follow in their books. If this be continued for half an hour, or longer, the clever boys and at last even the stupid ones will try to repeat by heart what they have just read. For the tasks that are set must be short; not too long for an hour's lesson, or too hard for the boys to understand.

(iv.) No fresh work should be done in the afternoon, but the lessons done in the morning should be repeated. The pupils should transcribe portions of their printed books, and should compete with one another to see who can best remember the morning's lesson, or who is most proficient in writing, in singing, or in counting.

18. Not without reason do we recommend that all the pupils copy their printed books as neatly as they can. (1) The manual exercise of copying will help to impress on their minds the matter copied. (2) If the
practice be made a daily one, it will teach them to write well, quickly, and accurately, and this will be of the greatest use in the further prosecution of their studies, and in conducting the affairs of life. (3) This will be the surest proof to parents that their children are not wasting their time at school, and will enable them to judge how much progress they are making.

19. We have no space to go into further particulars at present, and will only touch on one more point. If any boys are to learn foreign languages, they should learn them now, at about the age of ten, eleven, or twelve, that is to say, between the Vernacular-School and the Latin-School. The best way is to send them to the place where the language that they wish to learn is spoken, and in the new language to make them read, write, and learn the class-books of the Vernacular-School (the subject-matter of which is already familiar to them).
CHAPTER XXX

SKETCH OF THE LATIN-SCHOOL

1. In this school the pupils should learn four languages and acquire an encyclopædic knowledge of the arts. Those youths who have completed its whole curriculum should have had a training as:

(i.) Grammarians, who are well versed in Latin and in their mother-tongue, and have a sufficient acquaintance with Greek and Hebrew.

(ii.) Dialecticians, who are well skilled in making definitions, in drawing distinctions, in arguing a point, and in solving hard questions.

(iii.) Rhetoricians or orators, who can talk well on any given subject.

(iv.) Arithmeticians, and (v.) geometricians; both on account of the use of these sciences in daily life, and because they sharpen the intellect more than anything else.

(vi.) Musicians, both practical and theoretical.

(vii.) Astronomers, who have, at any rate, mastered the rudiments, such as the knowledge of the heavenly bodies, and the calculation of their movements, since without this science it is impossible to understand not only physics but also geography and a great part of history.

2. The above are commonly known as the seven liberal arts, a knowledge of which is demanded from a doctor of philosophy. But our pupils must aim higher than this, and in addition must be:

(viii.) Physicists, who know the composition of the earth,
the force of the elements, the different species of animals, the powers of plants and of minerals, and the structure of the human body, and who, besides knowing these things, can apply them to the various uses of life. Under this head is thus comprised a part of medicine, of agriculture, and of other mechanical arts.

(ix.) Geographers, who are well acquainted with the external features of the earth, and know the seas, the islands that are in them, the rivers, and the various kingdoms.

(x.) Chronologers, who can fix periods of time, and trace the course of the centuries from the beginning of the world.

(xi.) Historians, who possess a fair knowledge of the history of the human race, of the chief empires, and of the Church, and who know the various customs and fortunes of races and of men.

(xii.) Moralists, who can draw fine distinctions between the various kinds of virtue and of vice, and who can follow the one and avoid the other. This knowledge they should possess both in its general form and in its special application to the life of the family, of the state, and of the Church.

(xiii.) Finally, we wish them to be theologians, who, besides understanding the principles of their faith, can also prove them from the Scriptures.

3. When this course is finished, the youths, even if they have not a perfect knowledge of all these subjects (indeed at their age perfection is impossible, since experience is necessary to complete the theoretical knowledge that they have acquired, and the sea of learning cannot be exhausted in six years), should, at any rate, have laid a solid foundation for any more advanced instruction that they may receive in the future.

4. For the curriculum of six years, six distinct classes will be necessary, the names of which, starting from the lowest, might be as follows:—

(i.) The Grammar class.
(ii.) The Natural Philosophy class.
(iii.) The Mathematical class.
(iv.) The Ethics class.
THE GREAT DIDACTIC

(v.) The Dialectic class.
(vi.) The Rhetoric class.

5. I presume that no one can raise any objection to my placing grammar first, since it is the key of all knowledge; but to those who are always guided by custom it may seem strange that I have placed real studies before dialectic and ethics. No other arrangement, however, is possible. It has already been shown that the study of facts must precede that of their combinations, that matter logically precedes its form, that this is the only method by which sure and rapid progress can be made, and that we must therefore learn our facts by observation before we can either pass a sound judgment on them, or enunciate them in well-turned phrases. A man may have the whole apparatus of logic and of eloquence at his fingers' ends, but of what value can his investigation or his proof be, if he be ignorant of the objects with which he is dealing? It is as impossible to talk sensibly about matters with which we are not acquainted as it is for a virgin to bring forth a child. Things exist in themselves, and are quite independent of their relation to thought and to speech. But thought and speech have no meaning apart from things, and depend entirely upon them. Unless it refers to definite objects, speech is nothing but sound without sense, and it is therefore absolutely necessary to give our pupils a thorough preliminary training in real studies.

6. Though many have held the contrary opinion, it has been conclusively shown by learned writers that the study of natural philosophy should precede that of ethics.

Lipsius, in his Physiology, bk. i. chap. i., writes as follows:

"I am distinctly in agreement with the distinguished authorities who hold that natural philosophy should come first. Its study is productive of great pleasure, stimulates and retains the attention, and forms a suitable introduction to ethics."

7. It is open to argument whether the Mathematical class should or should not precede the Natural Philosophy
class. It was with the study of mathematics that the ancients commenced the investigation of nature, for which reason they gave them the name of "The Sciences"; while Plato forbade those who were ignorant of geometry to enter his Academy. Their reasons for holding this view are easy to understand, since the sciences that deal with number and quantity make a special appeal to the senses, and are therefore easy to grasp; besides, they make a powerful impression on the imagination, and thus prepare the mind for studies of a more abstract nature.

8. All this is very true, but we have some other considerations to take into account: (1) In the Vernacular-School we advised the education of the senses, and the development of the mind through their means, and as our pupils have by this time been through a course of arithmetic they can scarcely be considered quite ignorant of mathematics. (2) Our method advances step by step. Before proceeding to complex problems of magnitude, we should deal with bodies in the concrete, and thus prepare our minds to grasp more abstract notions. (3) The curriculum of the Mathematical class, as drawn up by us, embodies most of the arts, and these cannot be thoroughly mastered without some knowledge of natural philosophy. But indeed, if others suggest a different order, and justify their preference by theoretical or practical reasons, I have no wish to gainsay them. My own view is opposed to theirs, and I have given my reasons for it.

9. As soon as a fair knowledge of Latin has been acquired (by the aid of the Vestibulum and the Janua, which are to be used in the first class), the pupils should be instructed in the science of first principles, commonly called metaphysics (though in my opinion it should be called prophysics or hypophysic, that is to say, antenatural or sub-natural). For this science embraces the primary and the most important principles of existence, dealing with the essential hypotheses on which all things depend, their attributes, and their logical differences; and includes the most general definitions, axioms, and laws of
nature. When these are known (and by my method the task is an easy one), it will be possible to learn particulars and details with little effort, since, in a way, they will already be familiar, and nothing will be necessary but the application of general principles to particular instances. Immediately after this grounding in first principles, which should not occupy more than three months (for they will be speedily learned, being principles of pure reason and easily grasped by the mind), we may proceed to deal with the visible universe, that the marvels of nature (already set forth in the prophysic) may be demonstrated more and more clearly by particular examples. This will be supplied by the Natural Philosophy class.

10. From the essential nature of things we proceed to the more exact investigation of their accidental properties, and this we call the Mathematical class.

11. The pupils must next investigate man himself, viewed as a free agent and as the lord of creation. They must learn to notice what things are in our power, what are not, and how everything must submit to the inflexible laws of the universe.

This they will learn in the fourth year, in the Ethics class. But this must not consist of an historical course or of a mere statement of facts, as in the Vernacular-School. The reasons which underlie each fact must be given, that the pupils may acquire the habit of concentrating their attention on cause and effect. All controversial matter, however, must be carefully excluded from these first four classes, since we wish this to be reserved for the fifth class that follows.

12. In the Dialectic class, after a brief training in the laws of reasoning, the pupils should go over the whole field of natural philosophy, mathematics, and ethics, and carefully investigate any weighty points that are usually discussed by learned men. This gives an opportunity for explaining the cause and the nature of the controversy, for distinguishing between the thesis and the antithesis, and for showing by what arguments, real or plausible,
either may be controverted. The mistakes of the opposite side should then be exposed, and the cause of error and the fallacy of the arguments employed should be clearly shown; while, if there be an element of truth on both sides, the conflicting arguments may be reconciled. The utility of this process will be great, as it will not only comprise the recapitulation of facts already known, and illustrate those that are less familiar, but will at the same time teach the art of reasoning, of investigating what is unknown, and explaining what is obscure, of simplifying ambiguity, limiting statements that are too general, defending the truth with the weapons of truth, unmasking falsehood, and setting in order facts that are confused.

13. Last of all comes the Rhetoric class. In this the pupils should be taught to make an easy and profitable use of all that they have hitherto learned, and here it will be seen that they have learned something and have not spent their time in vain. For, in accordance with the saying of Socrates, "Speak, that I may see your character," we must train them to speak well, now that we have taught them to think accurately.

14. Therefore, after a preliminary training in the shortest and simplest rules of oratory, they should proceed to put these into practice by imitating the best masters. They should, however, not confine themselves to the subjects that they have already studied, but should traverse the whole field of truth, of existence, of human life, and of divine wisdom; that if they know anything which is true, good, pleasant, or useful they may be able to express it in suitable language, or, if necessary, to hold a brief for it. For this purpose they will at this stage be supplied with a mental furniture that is by no means to be despised, namely, a varied acquaintance with the facts of nature, and a good stock of words, of phrases, and of historical knowledge.

15. But of this we can speak more fully elsewhere; that is to say, if it be necessary, since the details will work themselves out in practice. We will only touch on one
point further. An acquaintance with history is the most important element in a man's education, and is, as it were, the eye of his whole life. This subject, therefore, should be taught in each of the six classes, that our pupils may be ignorant of no event which has happened from ancient times to the present day; but its study must be arranged in such a way that it lighten their work instead of increasing it, and serve as a relaxation after their severer labours.

16. Our idea is that each class should have its own hand-book, dealing with some special branch of history; for example:

In class i. An epitome of Biblical history.
   ii. Natural history.
   iii. The history of art and of inventions.
   iv. The history of morals.
   v. The history of customs, treating of the habits of different nations.
   vi. The general history of the world and of the principal nations; but especially of the boys' native land, dealing with the whole subject tersely and comprehensively.

17. As regards the special method to be employed, I will make only one remark. The four hours of daily class instruction should be arranged as follows: the two morning hours should be devoted (as soon as morning prayer has been held) to the science or the art that forms the special subject of the class. Of the afternoon hours the first should be given to history, and, in the second, the pupils should be made to exercise style, declamation, and the use of their hands, in accordance with the requirements of the class.
CHAPTER XXXI

OF THE UNIVERSITY

1. Our method does not really concern itself with University studies, but there is no reason why we should not state our views and our wishes with regard to them. We have already expressed our opinion that the complete training in any of the sciences or faculties should be reserved for the University.

2. Our ideal scheme is as follows:
   (i.) The curriculum should be really universal, and provision should be made for the study of every branch of human knowledge.
   (ii.) The methods adopted should be easy and thorough, that all may receive a sound education.
   (iii.) Positions of honour should be given only to those who have completed their University course with success, and have shown themselves fit to be entrusted with the management of affairs.

We will briefly give some details on each of these points.

3. If its curriculum is to be universal, the University must possess (1) learned and able professors of all the sciences, arts, faculties, and languages, who can thus impart information to all the students on any subject; (2) a library of well-selected books for the common use of all.

4. The studies will progress with ease and success if, firstly, only select intellects, the flower of mankind, attempt them. The rest had better turn their attention to more suitable occupations, such as agriculture, mechanics, or trade.
5. Secondly, if each student devote his undivided energies to that subject for which he is evidently suited by nature. For some men are more suited than others to be theologians, doctors, or lawyers, just as others have a natural aptitude for and excel in music, poetry, or oratory. This is a matter in which we are apt to make frequent mistakes, trying to carve statues out of every piece of wood, and disregarding the intention of nature. The result is that many enter on branches of study for which they have no vocation, produce no good results in them, and attain to greater success in their subsidiary pursuits than in those that they have chosen.

A public examination, therefore, should be held for the students who leave the Latin-School, and from its results the masters may decide which of them should be sent to the University, and which should enter on the other occupations of life. Those who are selected will pursue their studies, some choosing theology, some politics, and some medicine, in accordance with their natural inclination and with the needs of the Church and of the state.

6. Thirdly, those of quite exceptional talent should be urged to pursue all the branches of study, that there may always be some men whose knowledge is encyclopædic.

7. Care should be taken to admit to the University only those who are diligent and of good moral character. False students, who waste their patrimony and their time in ease and luxury, and thus set a bad example to others, should not be tolerated. Thus, if there is no disease, there can be no infection, and all will be intent upon their work.

8. We said that every class of author should be read in the University. Now this would be a laborious task, but its use is great, and it is therefore to be hoped that men of learning, philologers, philosophers, theologians, physicians, etc., will render the same service to students as has been rendered to those who study geography by geographers. For these latter make maps of the provinces, kingdoms, and divisions of the world, and thus present to
the eye huge tracts of sea and land on a small scale, so that they can be taken in at a glance. Painters, also, produce accurate and life-like representations of countries, cities, houses, and men, no matter of what size the originals may be. Why, therefore, should not Cicero, Livy, Plato, Aristotle, Plutarch, Tacitus, Gellius, Hippocrates, Galen, Celsus, Augustine, Jerome, etc., be treated in the same way and epitomised? By this we do not allude to the collections of extracts and flowers of rhetoric, that are often met with. These epitomes should contain the whole author, only somewhat reduced in bulk.

9. **Epitomes of this kind will be of great use.** In the first place it will be possible to obtain a general notion of an author when there is no time to read his works at length. Secondly, those who (following Seneca's advice) wish to confine themselves to the works of one writer (for different writers suit different dispositions), will be able to take a rapid survey of all and to make their choice in accordance with their tastes. Thirdly, those who are going to read the authors in their entirety will find that these epitomes enable them to read with greater profit, just as a traveller is able to take in the details of his journey with greater ease, if he have first studied them on a map. Finally, these abstracts will be of great use to those who wish to make a rapid revision of the authors that they have read, as it will help them to remember the chief points, and to master them thoroughly.

10. **Summaries of this kind may be issued both separately (for the use of poor students and those who are not in the position to read the complete works) and bound up with the complete works, that those who wish to read them may get an idea of the subject-matter before they begin.**

11. As regards academic exercises, I imagine that public debates, on the model of a Gellian society, should be of great assistance. Whenever a professor delivers lectures on any subject, works which treat of that subject, and these the best that exist, should be given to the students for their private reading. Then the morning
lecture of the professor should serve as the subject for an afternoon debate, in which the whole class may join. One student may ask a question about some point that he does not understand, and may point out that in the author which he has been studying he has found an opinion, backed by reasonable arguments and opposed to that of the professor. Any other student may then rise (some forms of order being observed), and may answer the question raised; while others may then decide if the point has been properly argued. Finally the professor, as president, may terminate the discussion. In this way, the private reading of each student will be of use to the whole class, and the subject will be so impressed on their minds that they will make real progress in the theory and practice of the sciences.

12. This practice of dissertation may be the means of fulfilling my third wish, that public posts of honour be given to none but the worthy. This result will be obtained if the appointment to these posts depend not on the decision of one man, but on the unanimous opinion of all. Once a year, therefore, the University should be visited by commissioners appointed by the king or by the state, just as the Latin-School is examined by its masters. The industry of the professors and students can thus be tested, and the most diligent of the latter should receive a public recognition of merit by having the degree of doctor or of master conferred upon them.

13. It is most important that everything be conducted with perfect fairness, and therefore, instead of allowing the academic degree to be won by a disputation, the following plan should be adopted. The candidate (or several at once) should be placed in the midst. Then men of the greatest knowledge and experience should question him and do all they can to find out what progress he has made, both in theory and in practice. For example, they may examine him on the text of the Scriptures, of Hippocrates, of the Corpus Juris, etc.; asking him where such and such a passage occurs, and how it agrees with some other
passage? if he knows of any writer who holds a different opinion, and who that writer is? What arguments he brings to bear, and how the contradictory views may be reconciled? with other similar questions. A practical examination should then follow. Various cases of conscience, of disease, and of law should be submitted to the candidate, and he should be asked what course of action he would pursue, and why? He should thus be examined with regard to a number of cases, until it is evident that he has an intelligent and thorough grasp of his subject. Surely, students who knew that they were to be publicly examined with such severity, would be stimulated to great industry.

14. There is no need to say anything about travel (to which we assigned a place in this last period of six years, or at its conclusion), except to remark that we are at one with Plato, who forbade the young to travel until the hot-headedness of youth had passed away, and they were sufficiently versed in the ways of the world to do so with advantage.

15. It is scarcely necessary to point out how useful a School of Schools or Didactic College would be, in whatever part of the world it were founded. Even if it be vain to hope for the actual foundation of such a college, the desired result might still be brought about, existing institutions being left as they are, if learned men would work together, and in this way seek to promote the glory of God. These men should make it the object of their associated labours to thoroughly establish the foundations of the sciences, to spread the light of wisdom throughout the human race with greater success than has hitherto been attained, and to benefit humanity by new and useful inventions; for, unless we wish to remain stationary or to lose ground, we must take care that our successful beginnings lead to further advances. For this no single man and no single generation is sufficient, and it is therefore essential that the work be carried on by many, working together and employing the researches of their predecessors as a starting-point. This Universal College, therefore, will bear
the same relation to other schools that the belly bears to
the other members of the body; since it will be a kind of
workshop, supplying blood, life, and strength to all.

16. But we must return to our subject and say what
remains to be said about our schools.
CHAPTER XXXII

OF THE UNIVERSAL AND PERFECT ORDER OF INSTRUCTION

1. We have now spoken at length on the necessity of reforming schools and on the methods by which this reformation can be effected. It will not be amiss if we give a brief summary of our ideals and of the means we have proposed for their realisation.

2. Our desire is that the art of teaching be brought to such perfection that there will be as much difference between the old system and the new, as there is between the old method of multiplying books by the pen and the new method introduced by the printing-press; that is to say, the art of printing, though difficult, costly, and complicated, can reproduce books with greater speed, accuracy, and artistic effect, than was formerly possible; and, in the same way, my new method, though its difficulties may be somewhat alarming at first, will produce a greater number of scholars and will give them a better education as well as more pleasure in the process of acquiring it, than did the old lack of method.

3. It is easy to imagine how impracticable the first attempts of the inventor of printing must have appeared, in comparison with the simple use of the pen; but the event showed of what great use the invention was. For, firstly, by means of a printing-machine two youths can now produce more copies of a book than could have been written by two hundred in the same time.

Secondly, manuscript copies differ in the number and
size of their pages, and the individual lines do not correspond to one another; while printed copies are as like to their original as one egg is like to another, and this is a great advantage.

Thirdly, it is impossible to tell if manuscripts are correct without revising them and comparing them accurately with the original, and this is a laborious and wearisome task. But in the case of printed books the correction of one proof ensures the accuracy of thousands of copies. This would seem incredible to any one unacquainted with printing, but is nevertheless true.

Fourthly, only firm and stiff paper is suitable to write on, but printing is possible on thin and flimsy paper, or on linen.

Finally, it is possible for men who are unable to write to be the most excellent printers; since it is not with their fingers that they carry out the operation, but by means of skilfully arranged type that cannot err.

4. Similar results might be obtained if this new and comprehensive method of teaching were properly organised (for as yet the universal method exists only in expectation and not in reality), since (1) a smaller number of masters would be able to teach a greater number of pupils than under the present system. (2) These pupils would be more thoroughly taught; (3) and the process would be refined and pleasant. (4) The system is equally efficacious with stupid and backward boys. (5) Even masters who have no natural aptitude for teaching will be able to use it with advantage; since they will not have to select their own subject-matter and work out their own method, but will only have to take knowledge that has already been suitably arranged and for the teaching of which suitable appliances have been provided, and to pour it into their pupils. An organist can read any piece of music from his notes, though he might not be able to compose it or to sing or play it from memory; and a school-master, in the same way, should be able to teach anything, if he have before his eyes the subject-matter and the method by which it should be taught.
5. Pursuing this analogy to the art of printing, we will show, by a more detailed comparison, the true nature of this new method of ours, since it will thus be made evident that knowledge can be impressed on the mind, in the same way that its concrete form can be printed on paper. In fact, we might adapt the term “typography” and call the new method of teaching “didachography.” But this conception we will analyze at length.

6. The art of printing involves certain materials and processes. The materials consist of the paper, the type, the ink, and the press. The processes consist of the preparation of the paper, the setting up and inking of the type, the correction of the proof, and the impression and drying of the copies. All this must be carried out in accordance with certain definite rules, the observance of which will ensure a successful result.

7. In didachography (to retain this term) the same elements are present. Instead of paper, we have pupils whose minds have to be impressed with the symbols of knowledge. Instead of type, we have the class-books and the rest of the apparatus devised to facilitate the operation of teaching. The ink is replaced by the voice of the master, since this it is that conveys information from the books to the minds of the listener; while the press is school-discipline, which keeps the pupils up to their work and compels them to learn.

8. Any kind of paper can be used, but the cleaner it is, the better it will receive the impress of the type. In the same way, our method can deal with any class of intelligence, but succeeds best with talented pupils.

9. There is a great analogy between the type and the class-books (that our method requires). Firstly, the type have to be cast and polished, before books can be printed; and in the same way the necessary apparatus must be provided before we can begin to use the new method.

10. A considerable quantity of type is required to print a whole work, and the same thing holds good of class-books and teaching apparatus; since it is irritating,
tedious, and fatal to good teaching to begin and then to be compelled to leave off through lack of the proper appliances.

11. A well-managed printing-press is supplied with all kinds of type, and is thus equal to every demand that can be made upon it; and, similarly, our class-books must contain everything necessary for a thorough education, that there may be no one who by their aid cannot learn whatever should be learned.

12. The type are not left in confusion, but are neatly arranged in boxes that they may be ready to hand when needed. Similarly, our class-books do not present their subject-matter to the pupil in a confused mass, but split it up into sections, allotting so much to a year, a month, a day, and an hour.

13. Only those type which are needed at the minute are taken from the type-cases; the rest remain undisturbed. Similarly, no books but those intended for his class should be given to a boy; others would only confuse and distract him.

14. Finally, type-setters use a straight edge which helps them to arrange the words in lines, and the lines in columns, and prevents any part from getting out of place. In the same way the instructors of the young should have some standard or model to aid them in their work; that is to say, guide-books should be written for their use, and these should tell them what to do on each occasion, and should preclude the possibility of error.

15. There will, therefore, be two kinds of class-books, those that contain the subject-matter and are intended for the pupils, and guide-books to assist the teacher to handle his subject properly.

16. As we have already remarked, it is the voice of the teacher that corresponds to the ink used in printing. If it be attempted to use type when they are dry, nothing but a faint and evanescent mark is made on the paper, in contrast to the firm and almost indelible impression that results when they have been inked. Similarly, the in-
struction that boys receive from books, those dumb teachers, is obscure and imperfect, but when it is supplemented by the voice of the teacher (who explains everything in a manner suitable to his hearers), it becomes vivid and makes a deep impression on their minds, so that they really understand what they learn and are conscious that they understand it. Again, printing-ink differs from writing-ink, since it is made, not with water, but with oil (indeed, those who want a very superior ink, use the finest oil and the best charcoal); and, similarly, the voice of a teacher who can teach persuasively and clearly should sink like oil into the pupils’ minds and carry information with it.

17. Finally, the function of the press in printing is performed in schools by discipline, which is in itself sufficiently powerful to ensure that no pupil shirk his studies. Every sheet of paper that is to form part of a book must pass through the press (hard paper needing more, and soft paper less pressure); and, similarly, whoever wishes to learn at a school must be subjected to its discipline. There are three grades of discipline: firstly, perpetual watchfulness; for since we can never put implicit faith in the diligence or innocence of boys (are they not Adam’s brood?) we must keep them continually under our eyes. Secondly, blame, by which those who leave the beaten path must be recalled to the way of reason and obedience. Finally, punishment, which must be employed if exhortation have no effect. All discipline, however, must be used with prudence and with no other object than to induce the pupils to do all their work well.

18. I said that certain processes were necessary, and that these had to be carried out in a certain definite manner. This point deserves a brief investigation.

19. If a certain number of copies of a book is to be printed, that number of sheets is taken at once and printed from the same block, and from each successive block, from the beginning to the end of the book, the same number of sheets, and neither more nor less, is printed; since otherwise some copies of the book would be imperfect. In the
same way, our didactic method lays it down as an essential condition that the whole school be given over at one and the same time to the teaching of one master, that from beginning to end all the scholars be subjected to a graduated course of instruction, and that none be allowed to enter after the session has once begun, or to leave before it is finished. In this way it will be possible for one master to teach a large number of pupils, and for all the pupils to learn every branch of knowledge thoroughly. It will therefore be necessary for all the public schools to open and to close at the same time (it suits our method best if the schools open in autumn rather than in spring), in order that the task allotted to each class may be completed each year, and that all (except those wanting in intellect) may be brought up to a certain standard at the same time, and may enter the next class together. This is an exact analogy of the method used in printing when all the copies of the first page are printed first, then those of the second page, and so on.

20. The better class of books are divided into chapters, columns, and paragraphs, and have spaces on their margins and between their lines. Similarly, our didactic method must have its periods of toil and of rest, with definite spaces of time set apart for honest recreation. The tasks are mapped out for each year, month, day, and hour, and if these divisions are duly observed no class can fail to reach the necessary standard at the end of the session. There are excellent reasons why the hours of public instruction should not exceed four daily, of which two should be before, and two after mid-day. On Saturday the two afternoon hours may be remitted, and the whole of Sunday should be devoted to divine service, so that we have thus twenty-two hours weekly and (making allowance for the holidays) about a thousand hours yearly. How much might be taught and learned in this time, were it only methodically employed!

21. As soon as the type has been set up, the paper is flattened out and laid ready to hand, that nothing may
impede the process of printing. Similarly, a teacher should place his pupils in front of him that he may see them and be seen by all. This we have already shown in chap. xix. Problem 1.

22. The paper is damped and softened, that it may be better fitted to receive the impression of the type. Similarly the pupils in a school must continually be urged to attend, as we have already explained.

23. When this has been done, the type are inked, that a distinct impression may be taken from them. Similarly, the teacher makes the lesson vivid by means of his voice, reading it over and explaining it, that all may understand.

24. The paper is then put into the press, one piece after the other, that the metal type may impress their form on each and every sheet. Similarly, the teacher, after he has explained a construction, and has shown by examples how easily it can be imitated, asks individual pupils to reproduce what he has said, and thus show that they are not merely learners, but actually possessors of knowledge.

25. The printed sheets are then exposed to the wind and are dried. Similarly, in school, the intellects of the pupils are exposed to the bracing influences of repetition, examination, and emulation, until it is certain that the lesson has been thoroughly learned.

26. When they have passed through the press, the printed sheets are all taken and arranged in order, that it may be seen if the copies are complete and without defects, and are therefore fit to be bound, sold, and used. The same function is performed in schools by the examination at the end of the year, when the progress of the pupils, and the thoroughness and comprehensiveness of their training, are investigated by the inspectors; the object being that these latter may certify that the subjects appointed have been properly learned.

27. So far we have confined ourselves to generalities, reserving our detailed investigation for a more suitable occasion. For the present it is sufficient to have shown that our discovery of didachography, or our universal
method, facilitates the multiplication of learned men in precisely the same way that the discovery of printing has facilitated the multiplication of books, those vehicles of learning, and that this is greatly to the advantage of mankind, since “the multitude of the wise is the wisdom of the world” (Wisdom vi. 24). And, since our desire is to increase the sum of Christian wisdom, and to sow the seeds of piety, of learning, and of morality in the hearts of all who are dedicated to God, we may hope for the fulfilment of the divine prophecy: “The earth shall be full of the knowledge of God, as the waters cover the sea” (Isaiah xi. 9).
CHAPTER XXXIII

OF THE THINGS REQUISITE BEFORE THIS UNIVERSAL METHOD CAN BE PUT INTO PRACTICE

1. There is no one, I imagine, who, after a careful examination of the question, will not perceive how blessed would be the condition of Christian kingdoms and states if they were supplied with schools of the kind that we desire. We must therefore see what is necessary in order that these speculations may not remain speculations, but may be realised in some definite form. Not without reason does John Cæcilius Frey express his surprise and indignation that throughout so many centuries no one has ventured to reform the barbarous customs of our schools and universities.

2. For more than a hundred years much complaint has been made of the unmethodical way in which schools are conducted, but it is only within the last thirty that any serious attempt has been made to find a remedy for this state of things. And with what result? Schools remain exactly as they were. If any scholar, either privately or in school, embarked on a course of study, he found himself a butt for the mockery of the ignorant or the malevolence of the ill-disposed, or finally, being unable to obtain any assistance, found his endeavour too laborious, and gave it up. Thus all efforts have hitherto been in vain.

3. We must therefore seek and find some way by which, with God's assistance, motive power may be supplied to the machine that is already sufficiently well constructed,
or at any rate can be constructed on the foundations which exist, if the obstacles and hindrances that have hitherto been present be wisely and firmly removed.

4. Let us isolate and examine these obstacles.

(i.) There is a great lack of methodical teachers who could take charge of public schools and produce the results that we have in view (indeed, with regard to my Janua which is already used in schools, a man of great judgment has written to me complaining that in most places one thing is lacking, namely, suitable men to use it).

5. (ii.) But even if teachers of this kind existed, or if they could all perform their task with ease by using time-tables and forms all ready prepared for them, how would it be possible to support them in each village and town, and in every place where men are born and brought up in Christ?

6. (iii.) Again, how can it be arranged that the children of the poor shall have time to go to school?

7. (iv.) The opposition of pedants, who cling to old ways and despise everything that is new, is greatly to be dreaded, but for this some remedy can easily be found.

8. (v.) There is one factor which by its absence or its presence can render the whole organisation of a school of no avail or can aid it in the highest degree, and that is a proper supply of comprehensive and methodical class-books. Since the invention of printing, it has been an easy matter to find men who are able and willing to make use of it, who will supply the funds necessary for the printing of good and useful books, and who will purchase books of this kind. Similarly, if the subsidiary apparatus necessary for comprehensive teaching were provided, it would be easy to find men to employ it.

9. It is evident, therefore, that the success of my scheme depends entirely upon a suitable supply of encyclopædic class-books, and these can be provided only by the collaboration of several original-minded, energetic, and learned men. For such a task transcends the strength of one man, and especially of one who is unable to devote his whole time to it, or who may be imperfectly acquainted with
some of the subjects that must be included in the comprehensive scheme. Moreover, if absolute perfection be desired, one lifetime is not sufficient for the completion of the work, which must therefore be entrusted to a collegiate body of learned men.

10. But it is impossible to call such a body into existence unless it be supported and financed by some king or state, while to ensure success a quiet and secluded spot and a library are necessary. In addition, it is essential that no one offer any opposition to such a goodly plan for glorifying the Creator and benefiting the human race, but rather that all prepare to work in harmony with the grace of God, which will be communicated to us more liberally through these new channels.

11. Therefore let your zeal blaze forth when ye hear this wholesome counsel. O dearest parents of children, into whose charge God has entrusted His most precious treasures, those made in His own image, may ye never cease to entreat the God of Gods that these efforts may have a successful issue, and by your prayers and solicitations to work upon the minds of powerful and learned men. In the meantime, bring up your children piously in the fear of God, and thus prepare the way for that more universal education of which we have spoken.

12. Do you also, O instructors of the young, whose task it is to plant and water the tender grafts of paradise, pray with all earnestness that these aids to your labours may be perfected and brought into daily use as soon as possible. For since ye have been called that "ye may plant the heavens and lay the foundations of the earth" (Isaiah li. 16), what can be more pleasing to you than to reap as rich a harvest as possible from your labour? Therefore, let your heavenly calling, and the confidence of the parents who entrust their offspring to you, be as a fire within you, and give you and those who come under your influence no rest until the whole of your native land is lit up by this flaming torch.

13. Ye men of learning, to whom God has given wisdom
and keen judgment that ye may be able to criticise such matters as these and improve them by your counsels, see that ye delay not to assist the sacred fire with your sparks, nay, rather with your torches and with your fans. Let all consider that saying of our Christ: "I came to cast fire upon the earth; and what will I if it is already kindled?" (Luke xii. 49). If He wish His fire to burn, woe unto him who, when he has the opportunity of bringing fuel to the flames, contributes nothing but the smoke of envy, malevolence, and opposition. Remember the reward that He promises to His good and faithful servants who employ the talents entrusted to them in such a way that they gain others, and the threats that He utters against the slothful who bury their talents in the earth (Matt. xxv. 25). Therefore, let not your own knowledge suffice you, but use all your strength to further the instruction of others. Be guided by the example of Seneca, who says: "I wish to communicate all that I know to others"; and again: "If knowledge were given me on the condition that I should keep it to myself and not share it with others, I should refuse it" (Epist. 27). Do not, therefore, withhold instruction and wisdom from the Christian people, but rather say with Moses: "Would God that all the Lord's peoples were prophets!" (Num. xi. 29). The reformation of the Church and of the state is comprised in the proper instruction of the young; and shall we, who know this, stand idle, while others put their hand to the work?

14. May we all, with one accord, be moved to promote such a worthy object in every possible manner by advising, warning, exhorting, reforming, and in every way furthering the work for God and for posterity. And let no one think that he is not called upon to act in the matter. For though a man may be naturally unsuited to be a schoolmaster, or may be fully engaged by his duties as a clergyman, a politician, or a physician, he makes a great mistake if he think that he is on that account exempt from the common task of school-reform. If he wish to prove his devotion to his calling, to him who calls him, and to those to whom
he is sent, he is bound not only to serve his God, his Church, and his country, but also to train up others to do so after him. Socrates has been praised because he employed his time in educating the young instead of holding some public office. "It is of more use," said he, "to train men who can govern, than to govern oneself."

15. O learned scholars, I beseech you not to despise these suggestions because they originate with one less learned than yourselves. Remember the saying of Chrysippus: "Many a market-gardener has spoken to the point. Perchance an ass may know what you do not." And of Christ: "The wind bloweth where it listeth, and ye hear its voice, but know not whence it comes or whither it goes." In the sight of God I protest that it is not by any overweening confidence in myself, or by a desire for fame or for personal advantage, that I am impelled to advertise these ideas of mine. It is the love of God and the wish to improve the condition of humanity that goad me on, and will not suffer me to keep silence when my instinct tells me what should be done. Therefore, if any oppose my efforts, and hinder the realisation of my ideas instead of aiding it, let him be assured that he is waging war, not against me, but against God, against his own conscience, and against nature, whose will it is that what is for the common good be given over for the use of all men.

16. To you also I appeal, Theologians, since it is in your power to be the greatest assistance or the greatest obstacle to my designs. If you choose the latter course, the saying of Bernhard will be fulfilled: "That Christ has no bitterer enemies than His followers, and especially those who hold the first place among them." But let us hope that your actions will be worthier, and more suited to your calling. Remember that our Lord charged Peter to feed not only His sheep but also His lambs, enjoining him to take especial care of the latter (John xxi. 15). This is a reasonable injunction, since shepherds find it easier to feed sheep than to feed lambs, which have still to be moulded by the discipline of the flock and the staff of the herdsman.
Surely a man betrays his ignorance if he prefer unlettered hearers! What goldsmith does not try to procure the very purest gold? What shoemaker does not try to obtain the finest leather? Let us likewise be children of light and wise in our generation, and let us pray that schools may supply us with as many educated hearers as possible.

17. And suffer not envy to enter into your hearts, O servants of the living God, but rather lead others to that charity that envies not, seeks not its own advantage, and thinks no evil. Let no envious thoughts arise if others originate schemes that have never entered into your minds, but be content to learn from others; in order that (as Gregory says) all, being full of faith, may praise God, and may be instrumental in spreading the truth.

18. But to you, in particular, do I direct my prayers, ye rulers and magistrates, who, in God’s name, preside over human affairs. To you, as to Noah, it has been entrusted from on high to build an ark for the preservation of the Word of God in this terrible deluge of disasters (Gen. vi.). It is your duty, as it was that of the princes of old, to aid in the building of the sanctuary, and to see that no obstacle be placed in the way of the artificers whom the Lord has filled with His Spirit and has taught to devise ingenious plans (Exod. xxxvi.). You, like David and Solomon, should summon architects to build the temple of the Lord, and should supply them with the necessary materials (1 Kings vi.; 1 Chron. xxix.). You are those centurions whom Christ will love if you have loved His little ones, and erected schools for them (Luke vii. 5).

19. For Christ’s sake, for the sake of our children’s salvation, I beseech you to listen to me. This is a weighty question, and concerns the glory of God and the salvation of mankind. Well do I know how much you love your country. If a man came to you and promised to tell you how all your towns might be fortified at a slight cost, how all your youths might be instructed in the art of warfare, how your rivers might be made navigable and be filled with merchant-vessels, in short, how your state might be
brought to a higher pitch of prosperity and security, you would give, not only your careful attention, but your heartiest thanks as well, to him who showed such solicitude for your welfare. And now, what is far more important than any of these things has been shown you, namely, the real and never-failing method by which a supply of such men may be secured, men who, by discoveries such as I have indicated, can be of immense service to their country. With truth did the sainted Luther write, when exhorting the cities of Germany to found schools: “Where one ducat is expended in building cities, fortresses, monuments, and arsenals, one hundred should be spent in educating one youth aright, since, when he reaches manhood, he may induce his fellows to carry out useful works. For a good and wise man is the most precious treasure of a state, and is of far more value than palaces, than heaps of gold and of silver, than gates of bronze and bars of iron.” Solomon also is of the same opinion (Eccles. ix. 13). If then we acknowledge that no expense should be spared in order to give one youth a thorough education, what can we say when the gate is opened to the universal education of all, and to an unfailing method by which the understanding may be developed? when God promises to shower His gifts upon us? when our salvation seems so near at hand that His glory dwells with us on earth?

20. Open wide your gates, O princes, that the King of glory may come in (Psalm xxiv.). Give to the Lord glory and honour, ye sons of the mighty. May each one of you be like David, who swear unto the Lord, and vowed unto the mighty one of Jacob: “Surely I will not come unto the tabernacle of my house, nor go up into my bed; I will not give sleep to mine eyes, or slumber to mine eyelids; until I find out a place for the Lord, a tabernacle for the Mighty One of Jacob” (Psalm cxxxii.). Stay not to consider the expense. Give to the Lord, and He will repay you a thousandfold. He who says, “The silver is mine and the gold is mine” (Haggai ii. 9), can demand this as a right, yet of His mercy He adds (when exhorting the people
to build His temple): “Prove me now forthwith if I will not open you the windows of heaven, and pour you out a blessing that there shall not be room enough to receive it” (Mal. iii. 10).

21. Do Thou, therefore, O Lord our God, give each one of us a joyful heart to serve Thy glory as best he may. For Thine is the grandeur, the power, the glory, and the victory. All that is in heaven and in earth is Thine. Thine, O Lord, is the kingdom; Thou art over all princes. Thine are the riches, and Thine is the glory, the might, and the power; Thou canst glorify and magnify whatsoever Thou pleasest. For what are we, who have but received Thy gifts from Thy hands? We are but strangers in Thy sight as were our fathers. Our life on earth is but a shadow and passes away. O Lord our God, all that we do to the honour of Thy name, comes from Thee. Give to Thy Solomons a perfect heart that they may do all that tends to Thy glory (1 Chron. xxix.). Strengthen, O God, that which Thou hast wrought for us (Psalm lxviii. 28). Let Thy work appear unto Thy servants, and Thy glory upon their children. And let the beauty of the Lord our God be upon us; and establish Thou the works of our hands upon us (Psalm xc. 16). In Thee, O Lord, have I trusted, let me never be confounded. Amen.
NOTES

1. **Gregory Nazianzen.**—A Father of the Church in the fourth century. He was renowned for his eloquence, which he employed in combating the Arian heresy.

2. **Wolfgang Ratich or Ratke** (born at Wilster in 1571, died at Erfurt in 1635).—One of the immediate forerunners of Comenius in school reform. He enjoyed the patronage of Count Ludwig of Anhalt-Köthen, through whose liberality he was enabled to found a six-class school at Köthen, in accordance with his didactic principles. He also undertook the reorganisation of the schools at Augsburg, Weimar, Magdeburg, and Rudolfstadt. The lack of success that attended his efforts was due to his quarrelsome disposition and to his utter inability to establish a *modus vivendi* with his colleagues and assistants. For his Principles, see Intr. II.

3. **Eilhard Lubin** (born in 1565, in the Duchy of Oldenburg; died in 1621).—Professor of Poetry and Theology at the University of Rostock. His *Didactic*, quoted by Comenius in sec. 17 of his introduction, has not been preserved.

4. **Christopher Helwig** (1581-1617). Professor of Theology, of Greek, and of Oriental Languages in the University of Giessen. He was one of the Commissioners who examined Ratke’s didactic method in 1612.

5. **Franciscus Ritter.**—This may possibly have been a clergyman and mathematician of some repute in the Palatinate in the early seventeenth century. Morhof mentions him under the name Franciscus Ridderus (*Polyhistor*, i. 1. 16).

7. **Vogel.**—Probably Ezechiel Vogel, a schoolmaster at Göttingen, and author of a work, *Ephemerides linguae Latinae*, in which he shows how a boy, by working two hours daily, may learn Latin in one year.
8. Glaum; Wolfstirn.—Of the owners of these names I have been unable to obtain any information.

9. John Valentine Andreæ.—Court-preacher at Stuttgart, where he died in 1654. He was a considerable power in the Church and in the school-room.

10. Janus Cæcilius Frey.—A German physician residing at Paris, where he died of the plague in 1631. On educational questions he wrote several books, remarkable for their sound common-sense.

11. This section is signed with Andreæ’s name, but cannot have been written by him, as in the original Bohemian version of the Great Didactic it appears in a considerably altered form. Possibly the last sentence is quoted from one of Andreæ’s works.

12. Stobæus.—A native of Stobi in Macedonia, where he lived about 500 A.D., and composed an Anthology of extracts from as many as 500 Greek authors.

13. Pittacus of Mitylene.—One of the seven wise men of Greece. Lived about 600 B.C.

14. Sextus Pompeius Festus.—A Roman grammarian who lived towards the end of the fourth century A.D.

15. John Ludovic Vives.—One of the great pedagogues of the sixteenth century. Was born at Valencia in 1492; professed the “Humanities” at Louvain and was afterwards invited by Henry VIII. to England, where he became the tutor of the Princess Mary. His best known works on education are: De ratione studii puerilis epistola due; De tradendis disciplinis sive de institutione Christianae; De institutione fæmina Christianæ; Introductio ad Sapientiam.

16. Bernhard.—Abbot of Clairvaux in 1115. A man of great ecclesiastical and political influence, and one of the instigators of the Third Crusade.

17. Lactantius.—For some years tutor to a son of the Emperor Constantine. Converted to Christianity in middle life, he wrote a voluminous treatise, Divinarum institutionum libri vii.; a plea for Christianity, intended for pagans who had received a philosophic education. He died about 320 A.D.

18. Matthew Dresser (1536-1607).—Was successively Professor of Greek at Erfurt, Professor of Rhetoric at Jena, Rector of the school at Meissen, and Professor of Greek and Latin at Leipzig.

19. Liebhard Camerarius.—A renowned sixteenth century scholar and editor of the classics. Sympathised with the Reformation and was a friend of Melanchthon’s. Died in 1574.

20. Gulartius.—Nothing appears to be known of this scholar or his works.
21. GEORGE AGRICOLA (born in Saxony, 1490).—The founder of the modern school of mineralogy and metallurgy. Mining in Germany owed much to his researches, which were considered authoritative as late as the eighteenth century.

22. CHRISTOPHER LONGOLIUS (1488-1522).—Born at Mecheln and resident in Paris. A renowned classic of his day. Died at Padua.

23. HIPPOLITUS GUARINO.—Lived in the first half of the seventeenth century. Was town physician at Speyer.

24. JOHN PICO MIRANDOLO (1463-1494).—In early youth gave evidence of remarkable ability. When fourteen years old went to Bologna, where he studied canon law and philosophy. His memory was so retentive that if 20,000 words were repeated to him once, he could reproduce them in the same order. He published 900 theses and challenged the learned men of the whole world to dispute with him on any one of them. Accused of heresy, he was acquitted by Pope Innocent VIII. He died at Florence.

25. JOSEPH JUSTUS SCALIGER.—Flourished in France at the end of the sixteenth and beginning of the seventeenth centuries. Possessed a marvellous knowledge of the classics and of oriental languages. His learning was more than equalled by his vanity and quarrelsomeness.

26. PIERRE DE LA RAMÉE.—Professor of Mathematics and Humanity at the University of Paris in the middle of the sixteenth century. Was killed in the Massacre of St. Bartholomew, August 24th, 1572.

27. GREGORY CNAPIUS (1574-1638).—A Polish Jesuit, Professor of Oratory, Mathematics, and Theology. Was author of a *Thesaurum Polono-Latino-Gracum*.

28. Not *conjunctus* but *convincutus* is now the generally accepted derivation of *cunctus*.

29. JOACHIM FORTIUS OR RINGELBERG (died in 1536).—Born at Antwerp and brought up at the court of Maximilian I. A man of varied talent, and a voluminous author, he attained success as a mathematician, a philologist, a painter, and an etcher.

30. ROBERT FLUTT (1574-1637).—Born at Milgate in Kent. Travelled in France, Spain, Italy, and Germany, and finally settled in London, where he practised medicine. On physics he had the most fantastic notions, and imagined that the root principles of chemistry were to be found in the Bible. Was author of a *Meteorologica Cosmica*.

31. ANDREAS HYPERIUS (1511-1564).—A member of the Reformed Church, born at Ypres. He studied at Paris and lectured there on Dialectic and Rhetoric, afterwards becoming Professor of Theology at Marburg.

32. FULGENTIUS.—A Catholic Bishop who lived about 500 A.D.
He defended the views of the Orthodox Church against the Arian and Pelagian heresies.

33. Priscian.—A grammarian who lived and taught at Constantinople in the sixth century. His Latin Grammar was the basis for much of the grammatical instruction of the middle ages.

34. Expulsion of pagan books.—It is difficult to reconcile Comenius’ denunciation of the classics in this chapter with his introduction of them into his scheme elsewhere. In this phase of mind he does but return to the distrust displayed by the Church for the new learning introduced by the Renaissance. It is curious to note that no stress is laid on the Utilitarian and “pressure-of-other-subjects” argument now so frequently made use of. Comparatively recently (1850 and 1851) two French writers, the Abbé Gaume and Bastiat, have condemned the use of the classics in schools from a point of view very similar to that of Comenius. Gaume in a pamphlet, Le ver rongeur, maintained that all literature prior to Christ’s coming was devoid of morality, and that the Fathers should be read in preference to Latin writers of the golden age. Bastiat, in a curious book entitled Baccalauréat et Socialisme, objects to any study that will introduce school-boys to a people who, like the Romans, lived by robbery and oppression. “Cette nation,” he declares, “s’est fait une politique, une morale, une religion, une opinion publique conforme au principe brutal qui la conserve et la développe. La France ayant donné au clergé le monopole de l’éducation, celui-ci ne trouve rien de mieux à faire que d’envoyer toute la jeunesse française chez ce peuple, vivre de sa vie, s’inspirer de ses sentiments, s’enthousiasmer de ses enthousiasmes, et respirer ses idées comme l’air.”

35. Cassiodorus (died 562 A.D.).—Held high office under Theodoric and his successor. After the fall of the Goths he retired into seclusion and employed himself in writing works of a philosophic nature on grammar and orthography.

36. Pietro Bembo.—A renowned Italian Cardinal in the sixteenth century. Was secretary to Pope Leo X., and wrote with elegance in both Latin and Italian.

37. Isidorus (died 635 A.D.).—Bishop of Seville. Was a student of the classics in an age when they were generally neglected. Compiled a kind of encyclopædia entitled Originum sive Etymologiarum libri xx.

38. Sketch of the Mother-School.—It is interesting to observe the development or rather the application at the present day of Comenius’ ideas on infant education. The following extracts from the French code of 1887 reflect the Comenian spirit very markedly:

“L’école maternelle n’est pas une école au sens ordinaire du mot;
elle forme le passage de la famille à l'école, elle garde la douceur affectueuse et indulgente de la famille, en même temps qu'elle initie au travail et à la régularité de l'école.” . . . “Une bonne santé ; l'ouie, la vue, le toucher déjà exercés par une suite graduée de ses petits jeux et de ses petites expériences propres à l'éducation des sens ; des idées enfantines, mais nettes et claires, sur les premiers éléments de ce qui sera plus tard l'instruction primaire ; un commencement d'habitudes et de dispositions sur lesquelles l'école puisse s'appuyer pour donner plus tard un enseignement régulier ; le goût de la gymnastique, du chant, du dessin, des images, des récits ; l'empressement à écouter, à voir, à observer, à imiter, à questionner, à répondre ; une certaine faculté d'attention entretenue par la docilité, la confiance et la bonne humeur ; l'intelligence éveillée enfin et l'âme ouverte à toutes les bonnes impressions morales ; tels doivent être les résultats de ces premières années passées à l'école maternelle, et, si l'enfant qui en sort arrive à l'école primaire avec une telle préparation, il importe peu qu'il y joigne quelques pages de plus ou de moins du syllabaire.”

39. William Zepper.—A preacher at Herborn at the close of the sixteenth and beginning of seventeenth centuries.

40. John Henry Alsted.—See Intr. I. and II.

41. Simon Stevin (died 1633).—The author of numerous mathematical works and an inspector of dams in Holland.

42. Justus Lipsius (born 1574).—Resided at Louvain, where he wrote works of a philosophical nature. His learning and his literary style are greatly praised by Morhof.
APPENDIX

THE WORKS OF COMENIUS, ARRANGED IN CHRONOLOGICAL ORDER OF COMPOSITION

[C.] signifies that the work was written in Czech

1. 1612. Linguae Bohemicae Thesaurus, hoc est Lexicon plenissimum, Grammatica accurata, idiotismorum elegantiae emphases adagiaque.
2. 1612. Amphitheatrum Universitatis.
4. 1615. De angelis.
7. 1620. The spiritual salvation of faithful Christians, worn out by countless temptations. [C.]
11. 1622. Meditations on the Christian perfection, which God, in His Word, shows to His chosen ones; which He implants in them through His Spirit; and which, to their unspeakable blessedness, He kindles and brings to full completion. Prague, 1622. [C.]
12. 1622. The impregnable fortress of God’s name, where all find safety who fly thither in trials and in danger. [C.]
13. 1622. Lamentation of a Christian over the oppression of his Church and of his country. [C.]
14. 1623. The Labyrinth of the World and the Paradise of the Heart. Amsterdam, 1663. [C.]
15. 1623. The orphan’s plight. That is to say, abandonment by all friends, protectors, and helpers. Lissa, 1634. [C.]
17. 1625. The Revelations and Visions of Christopher Kotter. [C.]
19. 1628-32. The Didactic of John Amos Comenius. Prague, 1849. [C.]
The Latin version, under the title Didactica Magna, was published at Amsterdam in 1657.
20. 1628. Informatorium of the Mother-School. Prague, 1858. [C.]
German version by Comenius. Lissa, 1633.
25. 1630. Funeral oration over Esther Sadowska (written in German).
27. 1631. Concordance of the Holy Scriptures. (Burnt at Lissa.)
31. 1632. History of the sufferings, the death, the burial, and the resurrection of Jesus Christ; compiled from the four Evangelists. [C.]
32. 1632. Historia Persecutionum Ecclesiae Bohemicae. Jam inde a primordiis conversionis suæ ad Christianismum, hoc est, Anno 894 ad Annun usque 1632. Ferdinando secundo Austriaco regnante, In qua Inaudita hactenus Arcana Politica consilia, artes, presentium
bellorum verse causae et judicia horrenda exhibentur. Nunc primum edita cum duplici Indice. A.D. 1648. Translated into Czech and published at Lissa in 1655.

33. 1632. Haggæus Redivivus. Sorrowful exhortation, in God’s name, of Christian rulers, of God’s ministers, and of all nations. [C.]
34. 1632. Short sketch of the reorganisation of schools in the Kingdom of Bohemia. [C.]
35. 1632. The Basis and Duration of the two Churches, the true and the false; of which the true Church, founded in Paradise through the name of Jesus Christ, will endure to the end of the World. [C.]
36. 1632. Some questions that concern the Unity of Bohemian Brethren. First printed in 1878. [C.]
38. 1632. Astronomia ad lumen Physicum reformanda.
39. 1632-3. The wisdom of the Forefathers set forth as a mirror for their Descendants. First printed in 1849. [C.]
42. 1634. Conatuum Comenianorum Praedium. Oxoniæ, 1637.
43. 1635. Leges Illustri Gymnasia Lesnensis.
44. 1635. Account of a tractate hostile to the Unity, by Samuel Martin, and refutation of the same. Lissa, 1636. [C.]
45. 1636. XXI. Sermons. Of the mysteries of Death and of Resurrection. Lissa, 1636. [C.]
46. 1636. The Mirror of Good Government. Funeral oration over Count Raphael of Lissa. Lissa, 1636. (Composed in German.)
47. 1637. J. A. Comenii Faber Fortunæ sive Ars consulendi ipsi sibi. Amsterodami, 1657.
48. 1637. The Way of Peace; that is to say, the only true and unfailing means by which God’s Church can be preserved in Harmony, Concord, and Love. Lissa, 1637. [C.]
51. 1638. Diogenes Cynicus Redivivus, sive De compendiose Philo-
THE GREAT DIDACTIC

54. 1639. A Dextris et Sinistris, hoc est pro fide in Christum, Deum-Hominem cum Marcioniticis deliriis (Humanitatem Christi abnegantibus) Lucta. Amsterodami, 1662.

57. 1641. Via Lucis. Hoc est, Rationabilis disquisitio, quomodo Intellectualis animorum Lux, Sapientia, tandem sub Mundi vesperam per omnes mentes et gentes feliciter spargi possit. Amstelodami, 1688.

59. 1643. Irenica quædam scripta Pro pace Ecclesiae.

60. 1643. Calendarium Ecclesiasticum.

64. 1645. Judicium Ulrici Neufeldii de Fidei Catholicæ Regula Catholica, Ejusque Catholicico Usu ad Valerianum Magnum Omnesque Catholicos. 1654.

65. 1645. Regulae Vitæ Sapientis, harmonicæ, tranquillæ, actuosæ, negotiis obrutæ, liberaliter otiosæ, peregrinantis denique. 1645.

67. 1646. Christianismus reconciliabilis reconciliatore Christo. Hoc est quam facile Christiani si vere ac serio Christiani esse velint, non discordare possint, tam clara ut Sol meridie est demonstratio.

68. 1648. Independentia æternarum Confosionum Origo Spectaminis Venerabilis Nationalis Synodi in Nomine Christi Londini in Anglia congregatæ subjecta Anno 1648.

69. 1649. Of the ‘casting out of the dumb and other devils. A sermon delivered at Lissa. 1649. [C.]

70. 1649. Index plenus vocum Germanicarum.

72. 1649. Manuductio in viam pacis ecclesiasticæ.

73. 1649. Funeral Oration over Paul Fabrik. [C.]

74. 1650. Syntagma rerum, conceptuum, et verborum.

75. 1650. The Will of the Dying Mother; in which she divides among her sons and heirs the treasures entrusted to her by God. Lissa, 1650. [C.]

77. 1651. De reperta ad Authores Latinos prompte legendos et clare intellegendos Facili Brevique Via, Schola Latina, Tribus Classibus divisa. Amsterodami, 1657.

79. 1651. J. A. Komensky’s The Art of Preaching. Prague, 1823. [C.]

80. 1651. Primitiae laborum Scholaricorum. 1651.

83. 1653. Fortius Redivivus, sive de pellenda Scholis ignavia.

85. 1653. Leges Scholæ bene ordinatæ.
314  

THE GREAT DIDACTIC

91. 1654. Gentis felicitas Speculo exhibita iis, qui num felices sint et quomodo fieri possint, cognoscere velint. 1659.

93. 1655. The struggle with God in prayer, followed by Resignation to His Will in death as in life. A sermon preached at Lissa on Sept. 24th; at the close of a day of great danger. 2nd ed. Halle, 1765. [C.]

95. 1655-6. Evigila Polonia.

96. 1656. Enoch; or, Of the continual intercourse of believers with God. 1656. [C.]

97. 1656. The Gift of Long Life. A sermon preached at the burial of Wacswlaw Lochar, Consenior of the Moravian Church at Lissa. [C.]

98. 1656. Materiarum Pansophicarum Sylva, Definitionum scil.
omnium rerum et Axiomatum (supra 20 annos magnâ diligentiâ Con
gestatus) thesaurus. Burnt at Lissa.

99. 1656. Sapientia Bis et Ter Oculata, Aliud in alio acute videns,
aliudque per aliu potenter demonstrans. Burnt at Lissa.

100. 1656. Lesnæ Excidium, Anno 1656 in Aprili factum, fide
historica narratum.

101. 1657. Parvulis parvulus, Omnibus Omnia. Hoc est Vestibuli
Lat. Lingæ Auctarium. Voces Latinas primitivas construï,
ceptas, et in Sententiolas breves redactas, exhibens. Amsterdami,
1657.

102. 1657. J. A. Comenii pro Latinite Janæe Linguarum suæ,
